Environmental Affairs Division

SUBJECT: Comprehensive Environmental Response, Compensation and Liability Act (CERCLA)/Interagency Agreement (IAG) Administrative Docket No. II-CERCLA-FFA-001-04: Submittal of **Final 48 Site Feasibility Study**: Reviews are ER, A-eligible

Mr. William Roach  
U.S. Environmental Protection Agency Region 2  
290 Broadway, 18<sup>th</sup> Floor  
New York, NY 10007-1866

Ms. Anne Pavelka, Case Manager  
New Jersey Department of Environmental Protection  
Division of Responsible Party Site Remediation  
401 East State Street, Floor 5 P. O. Box 420. Mail Code 401-05F  
Trenton, New Jersey 08625-0028

Dear Sir and Madam:

Enclosed for your records and approval are copies of the **Final 48 Site Feasibility Study** (FS). The EPA had approved the tracked-changed version of the document by the attached May 23rd 2014 email.

I am also providing responses to the few comments related to the two sites added to this FS that came from the "5-Site Feasibility Study". We acknowledge that NJDEP has not approved the earlier versions of this FS nor will NJDEP likely approve this version.

We intend during the next number of weeks to provide you drafts of 2 Proposed Plans; each will contain approximately 24 sites.

Sincerely,

A handwritten signature in blue ink, appearing to read "Ted R. ...".

Project Manager for Environmental  
Restoration

Enclosures

Subject: Re: Responses to your comments: Picatinny - 48-Site FS (UNCLASSIFIED)  
Ted,

The revisions made to the 48-Site FS sent in an e-mail dated 5/23/14 are satisfactory. Enjoy your weekend.

Bill

Bill:

The attached files address your comments that you provided yesterday on the 48 Site FS. To make facilitate your review, all the previous changes that were in the "Red-lined Strike-0ut" (RLSO) were "accepted".

Also included is the Word version of the text portion in case that is easier for you to look through. ARCADIS will review & format the revised document (and revised tables), but wanted to send to you as quickly as possible. Please let us know if you are ok with these edits.

Thanks. Have a good 3-day weekend (or 4-day weekend but in that case welcome back.)

Ted Gabel

Subject: Picatinny - 48-Site FS

Ted,

I have checked the tracked-changed 48-Site FS and it is acceptable except for the following comments:

1. Section 3.1.4.4, page 26, last paragraph - It is stated "CERCLA response actions will be evaluated for this site." This statement is no longer valid and should be deleted. This should also be done for all other sites where the statement appears in the document.
2. The risk assessment comments included in EPA comments dated December 2, 2013 requested that contaminants detected at Site 153 and 154 be compared to EPA RSLs to ensure that potential risk at the sites are within EPA's acceptable risk range. Please comply.
3. Appendix D, Engineering Assumptions and Response Action Alternatives is no longer relevant and should be removed from the document. If an appendix is needed for the cost estimate for Alternative 2, the appendix should be renamed.

Bill

**Responses to Comments on the  
Draft Final 48 Site Feasibility Study and Response Document  
Picatinny Arsenal, Morris County, New Jersey  
May 2014**

**Commenter: Anne Pavelka, NJDEP  
Comments Dated: May 30, 2014**

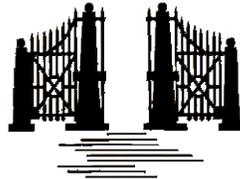

Item No.	Report Reference	Comment	Response
<p>The NJDEP has reviewed the 5/13/14 draft of the 48 Site Feasibility Study and the response to comment document. The NJDEP has determined that the previous NJDEP comments are still applicable to the document. The NJDEP did note that the Army has added Site 122/PICA 011 and Site 138/PICA 108 (107) to the 5/13/14 draft of the 48 Site Feasibility Study. Below are the NJDEP's comments on these sites.</p>			
1.	Site 122/PICA 011 – Building 60 Satellite Waste Accumulation Area	<p>Data indicates that surface soils at this site contain at least six SVOCs which were detected in surface soil samples at concentrations greater than the New Jersey Soil Remediation Standards (SRS). Maximum concentrations of 50 D mg/kg benzo(a)pyrene, 200 D mg/kg benzo(b)fluoranthene, 24 mg/kg benzo(k)fluoranthene, 4.2 mg/kg dibenz(a,h)anthracene, and 100 D mg/kg indeno(1,2,3-c,d)pyrene were detected at sample location D-SS122-6. Also, a concentration of 50 D mg/kg benzo(a)pyrene was also detected at D-SS122-2. A maximum concentration of 8.8 benz(a)anthracene (LOC = 2 mg/kg) was also detected at sample location D-SB122-2. PCBs are found in surface soil at concentrations up to 2.6 mg/kg. Subsurface soils contain PAHs and PCBs above NJSRS including maximum concentrations of 12 mg/kg benz(a)anthracene, 13 mg/kg benzo(a)pyrene, 15 mg/kg benzo(b)fluoranthene, 2.5 mg/kg dibenz(a,h)anthracene, and 9.4 mg/kg indeno(1,2,3-c,d)pyrene, as well as PCBs up to 64 mg/kg. In surface soils, one sample contained arsenic at a concentration of 21 mg/kg (NJSRS 19 mg/kg). The three soil samples contained concentrations of manganese that exceeded the NJSRS of 5900 mg/kg, including D-SS122-6, D-122-SS-008, and D-122-SS-009, which had respective concentrations of 15,000 mg/kg, 9530 mg/kg, and 7610 mg/kg.</p> <p>The proposed no further action remedy is not acceptable to NJDEP. A remedy must be proposed to address PAHs and all other contaminants that have NJ SRS exceedances at Site 122.</p>	<p>Noted. Under the CERCLA process under which Picatinny Arsenal is governed, unacceptable site-related risks are required before restoration actions are needed and can be taken. Risk assessments have been conducted at this site in accordance with USEPA risk assessment guidance, and no unacceptable risk has been found for the current and reasonably anticipated future land use. While the calculated hazard indices for the industrial/research worker and construction/excavation worker exceed the threshold of 1, with HIs of 8 and 40, the USEPA and Army agreed, as part of the 5-Site Dispute Resolution, that soil ARARs will not be required to be attained at Site 122 because USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant with an unacceptable risk/hazard, was not exceeded (USEPA, 2014). Thus, although a noncancer hazard was calculated, contaminant concentrations at this site do not present a noncancer hazard that must be actively mitigated. Further, there are no adverse impacts to ecological receptors. As such, no action is appropriately recommended under the CERCLA process.</p>

**Responses to Comments on the  
Draft Final 48 Site Feasibility Study and Response Document  
Picatinny Arsenal, Morris County, New Jersey  
May 2014**

**Commenter: Anne Pavelka, NJDEP  
Comments Dated: May 30, 2014**

Item No.	Report Reference	Comment	Response
2.	Site 138/ PICA 108 (107) –Buildings 404, 407 & 408, Chemical Lab & Propellant Plant	<p>Twenty-nine surface soil samples had detections of at least one SVOC at concentrations greater than its respective NJSRS. Maximum concentrations of benz(a)anthracene=(100 D mg/kg), benzo(b)fluoranthene = (200 D mg/kg), benzo(k)fluoranthene = (90 mg/kg), and indeno(1, 2, 3-c,d)pyrene = (70 mg/kg) were detected at location FSS138-6. Maximum concentrations of benzo(a) pyrene (78 mg/kg) and dibenz(a,h)anthracene (13 mg/kg) were detected at sample location F-138-SS-036. The maximum concentration of naphthalene (20 mg/kg) was detected at sample location F-SS138-9. PCBs were detected above the NJ non-residential SRS at 1.8 mg/kg in one surface soil sample location. Arsenic was detected at sample location F-SS138-10 at a concentration of 20.5 mg/kg, and manganese was detected at a concentration of 8500 D mg/kg at sample location F-SS138-6. The NJ SRS for manganese is 5900 mg/kg.</p> <p>The proposed no further action remedy is not acceptable to NJDEP. A remedy must be proposed to address PAHs and all other contaminants with NJ SRS exceedances at Site 138.</p>	<p>Noted. Under the CERCLA process (Superfund) under which Picatinny Arsenal is governed, unacceptable site-related risks are required before restoration actions are needed and can be taken. Risk assessments have been conducted at this site in accordance with USEPA risk assessment guidance, and no unacceptable risk has been found for the current and reasonably anticipated future land use. While the calculated hazard index for the construction/excavation worker exceeds the threshold of 1, HI=6, the USEPA and Army agreed, as part of the 5-Site Dispute Resolution, that soil ARARs will not be required to be attained at Site 138 because USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant with an unacceptable risk/hazard, was not exceeded (USEPA, 2014). Thus, although a noncancer hazard was calculated, contaminant concentrations at this site do not present a noncancer hazard that must be actively mitigated. the soil exposure point concentration for manganese is less than the USEPA's soil remediation goal for manganese (23,000 mg/kg). Further, there are no adverse impacts to ecological receptors. As such, no action is appropriately recommended under the CERCLA process.</p>

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

### Executive Summary

This report presents the methodology and results of a feasibility study (FS) conducted to address surface and subsurface soil, as well as sediment, surface water, and/or groundwater where applicable, at 48 sites in 17 PICA-numbered sites at Picatinny Arsenal, New Jersey:

- PICA-008 (007)/Site 1
- PICA-008/Site 2
- PICA-008 (157)/Site 4
- PICA-011/Site 122
- PICA-013/Site 78
- PICA-050/Site 3
- PICA-071/Sites 29
- PICA-071/Site 45/39
- PICA-075/Site 36
- PICA-075/Site 47
- PICA-075/Site 102
- PICA-075/Site 188
- PICA-091/Site 55
- PICA-091/Site 62
- PICA-091/Site 64
- PICA-091/Site 98
- PICA-091/Site 100
- PICA-091/Site 127
- PICA-091/Site 128
- PICA-091/Site 129
- PICA-091/Site 130
- PICA-091/Site 132
- PICA-107/Site 138
- PICA-108/Site 90
- PICA-108/Site 111
- PICA-108/Site 137
- PICA-108/Site 139
- PICA-108/Site 140
- PICA-108(210)/Site 210
- PICA-122/Site 126
- PICA-134/Site 30
- PICA-134/Site 70
- PICA-134/Site 83
- PICA-135/Site 71
- PICA-135(137)/Site 82
- PICA-135/Site 158
- PICA-135/Site 159
- PICA-136/Site 79
- PICA-162/Site 5
- PICA-162/Site 6
- PICA-175/Site 115
- PICA-175/Site 151
- PICA-175/Site 152
- PICA-175/Site 153
- PICA-175/Site 154
- PICA-200/Site 200
- PICA-209/Site 209

This FS was performed in accordance with the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). It should be noted that for PICA-008/Sites 1, 2, and 4 the only media included for evaluation in this FS is soil. At PICA-013/Site 78, the only media addressed include soils and sediment. The other media at these sites have been addressed under separate CERCLA Decision Documents.

Human Health Risk Assessments (HHRAs) and Ecological Risk Assessments (ERAs) were developed for the sites during the Remedial Investigations (RIs). The HHRA quantified potential risks and hazards associated with exposure to Chemicals of Potential Concern (COPCs) in soil at each site. The Screening Level ERAs (SLERAs)

and/or Baseline ERAs (BERAs) quantified potential risks associated with terrestrial and aquatic wildlife exposure to Chemicals of Potential Ecological Concern (COPECs) in soil, sediment, and surface water.

The HHRA was reassessed during preparation of this FS. Updated parameters include the soil-to-skin adherence factor (SSAF) for dermal absorption and baseline blood lead concentration, geometric standard deviation, exposure frequency, and soil ingestion rate for the Adult Lead Model. In addition, risk-based cleanup goals (RCBGs) and lead preliminary remediation goals (PRGs) were calculated. A memorandum summarizing the updated HHRA and calculated remedial goals is included as Appendix C. The results of the updated HHRA indicate potential risks to the industrial/research worker and construction excavation worker were within or lower than the United States Environmental Protection Agency (USEPA) generally acceptable risk range of 1E-04 to 1E-06 and hazards were lower than the threshold of 1.

While there are no unacceptable risks or hazards for the current and reasonably anticipated future use at these sites, in most cases, they cannot be released for unrestricted use due to unacceptable risks or hazards under the residential scenario. Consistent with CERCLA, remedies are assessed and selected based on human health risks and ecological impacts for only the current and reasonably anticipated future uses, which is military/industrial. Because there are no unacceptable risks for the current and reasonably anticipated use of these sites, only two Response Action (RA) alternatives are developed in this FS: No Further Action (NFA) and No Further Action with Monitoring of Land Use. The seven CERCLA evaluation criteria (overall protection of human health and the environment; compliance with Applicable or Relevant and Appropriate Requirements (ARARs); long-term effectiveness and permanence; reduction of toxicity, mobility, or volume of wastes; short-term effectiveness; implementability; and cost) were applied to compare the anticipated performance of each alternative. State and community acceptance will be evaluated fully in the Proposed Plan and documented in the Record of Decision (ROD). The two alternatives evaluated herein are listed below.

- Alternative 1 – No Further Action. No remedial action of any kind would be employed.
- Alternative 2 – No Further Action with Monitoring of Land Use. No remedial action of any kind would be employed; however, annual monitoring of existing controls and land use will be conducted and reports provided to USEPA and New Jersey

Picatinny Arsenal, New  
Jersey

Department of Environmental Protections (NJDEP) to ensure their uses remain consistent with the risk assessment assumptions (military/industrial).

Of the aforementioned sites in this FS, NFA is recommended for PICA-075/Site 36 and PICA-175/Site 154 because, although risk assessments were not conducted for these sites, data are less than the USEPA, NJDEP Residential Soil Remediation Standards (SRS), and/or background levels established for Picatinny Arsenal. Therefore, these sites have no unacceptable health risks or hazards associated with them for residential scenarios and can be released for unrestricted use. At the remaining 46 of the 48 sites/buildings addressed in this FS, the contaminant levels, risks, and hazards at the sites are not low enough to allow unrestricted use.

## **1. Introduction**

ARCADIS U.S. Inc. (ARCADIS) has been retained by the United States Army Environmental Command (USAEC) to perform Installation Restoration Program (IRP) activities at Picatinny Arsenal (Picatinny or PTA), located in Morris County, New Jersey. This work is being conducted under a Performance Based Contract that encompasses 45 Picatinny Arsenal (PICA) sites. The full scope of services for this contract is defined in Contract W91ZLK-05-D-0015 Task Order 0001.

This document has been prepared pursuant to United States Environmental Protection Agency (USEPA) guidance (USEPA 1988) under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) as amended by the Superfund Amendments and Reauthorization Act (SARA) of 1986 and the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) [40 Code of Federal Regulations (CFR) 300]; the National Environmental Policy Act of 1969; and the President's Council on Environmental Quality regulations (40 CFR 1500 – 1508).

This report presents the methodology and results of a feasibility study (FS) conducted to address surface and subsurface soil, sediment, surface water, and/or groundwater, where applicable, at the following 17 PICA-Sites (48 Remedial Investigation [RI] Concept Sites):

- PICA-008 – Buildings in Area J – consisting of Sites 1, 2, and 4
- PICA-011 – Satellite Waste Accumulation Area – consisting of Site 122
- PICA-013 – Building 91, Optics Prototype Facility – consisting of Site 78
- PICA-050 – Former Reaction Motors/Rocket Fuel Test Area, 1500 Series Buildings – consisting of Site 3
- PICA-071 – Drum Storage Yard – consisting of Sites 29 and 45/39
- PICA-075 – 3000 Area – consisting of Sites 36, 47, 102, and 188
- PICA-091 – 200 Area – consisting of Sites 55, 62, 64, 98, 100, 127, 128, 129, 130, and 132

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- PICA-107 - Buildings 404, 407, and 408, Chemical Lab and Propellant Plant – consisting of Site 138
- PICA-108 – Buildings in 300/400 Area – consisting of Sites 90, 111, 137, 139, 140, and PICA-210
- PICA-122 – Propellant Testing (Building 197) – consisting of Site 126
- PICA-134 – Buildings in Area I – consisting of Sites 30, 70, and 83
- PICA-135 – 900 Area – consisting of Sites 71, 82, 158, and 159
- PICA-136 – High Pressure Boiler (Building 3013) – consisting of Site 79
- PICA-162 – Shell Burial Area – consisting of Sites 5 and 6
- PICA-175 – 600 Area – consisting of Sites 115, 151, 152, 153, and 154
- PICA-200 – Buildings in Area L
- PICA-209 – Locomotive Area

It is noted that in some cases other CERCLA documents are evaluating, or have evaluated, media at some of these sites including:

- Surface water and sediment data related to the Picatinny Lake are being addressed in the Lakes FS (PICA-015, 057, and 195 [ARCADIS 2009a])
- Groundwater at several sites located within the Mid-Valley Region was addressed in the Record of Decision (ROD) (U.S. Army, 2012) and Remedial Design (RD) (ARCADIS, 2013) for the Mid-Valley
- Groundwater at Sites 29 and 45/39 was addressed in the FS for the Area D groundwater ROD (USEPA 2004a)
- For PICA-008/Sites 1, 2, and 4, the only medium included for evaluation in this FS is soil as groundwater and surface water have already been addressed under a separate action

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- For PICA-013/Site 78, the only media included for evaluation in this FS are soils and sediment as groundwater and surface water have already been addressed under a separate action

The purpose of the FS is to develop and evaluate response alternatives to assist in the selection of an appropriate response action for the sites. This FS addresses environmental media through the completion of the following tasks:

- Assessment of site-related human health risks and impacts to the environment
- Identification of remedial technologies
- As required by CERCLA/SARA, assembly of the remedial technologies into response action (RA) alternatives that, to the maximum extent practicable, utilize permanent solutions and alternative technologies
- Performance of a detailed analysis of the RA alternatives using the seven evaluation criteria listed in the NCP (State and Community Acceptance are evaluated in the Proposed Plan)

This FS includes 48 sites that were assessed during the RI process. The RI process identified several sites that exhibited risk to human health in exceedance of the 1E-04 cancer risk or noncancer hazard of 1. However, the human health risk assessment (HHRA) was reassessed and updated during preparation of this FS to include updated parameters. These parameters include the soil-to-skin adherence factor (SSAF) for dermal absorption and baseline blood lead concentration, geometric standard deviation, exposure frequency, and soil ingestion rate for the Adult Lead Model. A memorandum summarizing the updated HHRA is included as Appendix C.

Forty-four (44) sites in this FS have risks within or less than the USEPA generally acceptable risk range (1E-06 to 1E-04) for the current and reasonably anticipated future use (military/industrial). Two of the sites (PICA-011/Site 122 and PICA-107/Site 138) have hazard indices that are greater than the threshold value of 1 due to manganese; and the concentrations of manganese onsite are less than the EPA's soil remediation goal for manganese (23,000 mg/kg). Risk assessments were not conducted for PICA-075/Site 36 and PICA-175/Site 154 because no constituents of concern were identified; however, data for these sites are less than the United States Environmental Protection Agency (USEPA), New Jersey Department of Environmental Protections (NJDEP) Residential Soil Remediation Standards (SRS), and/or

background levels established for Picatinny Arsenal. Therefore, these sites have no unacceptable health risks or hazards associated with them for residential scenarios and can be released for unrestricted use.

### **1.1 Report Organization**

In addition to this introduction, this report is divided into eight sections as follows:

- Section 2 – Background: This section presents information regarding Picatinny Arsenal and individual site characteristics. The facility history, geology, topography, hydrogeology, surface water, wetlands, and Picatinny Master Plan are discussed.
- Section 3 – Site Summaries: The site summary section provides information regarding the site characteristics, site description, and site history. The scope and results of previous environmental investigations are summarized, as are the evaluations of human health risk and ecological risk resulting from exposure to contaminants present in this group of sites.
- Section 4 – Response Action. The scope and objectives of the response action are discussed.
- Section 5 – Identification and Screening of Remedial Technologies: Potential Remedial Technologies are discussed and evaluated.
- Section 6- Development of Response Action Alternatives: Two response action alternatives for this group of sites are identified.
- Section 7 – Evaluation of Response Action Alternatives: Using the seven criteria identified in the NCP [40 CFR 300.430(e)], an evaluation of response action alternatives for the sites is conducted.
- Section 8 – References: The references used to develop this report are provided.

## **2. Site Background**

### **2.1 Site Location and History**

Picatinny Arsenal is a 5,900 acre government-operated munitions research and development facility located in Morris County, New Jersey, approximately 40 miles west of New York City and four miles northeast of Dover, New Jersey. The Arsenal sits in the Highlands of the state of New Jersey (Figure 2-1).

Picatinny Arsenal was established in 1880 by the U.S. War Department as a storage and powder depot. Later it was expanded to assemble powder charges for cannons and to fill projectiles with maximitite (a propellant). During World War I (WWI), Picatinny Arsenal produced all sizes of projectiles. In the years following WWI, Picatinny Arsenal began projectile melt-loading operations and began to manufacture pyrotechnic signals and flares on a production basis. During World War II (WWII), Picatinny Arsenal produced artillery ammunition, bombs, high explosives, pyrotechnics, and other ordnance. After WWII, Picatinny Arsenal's primary role became the research and engineering of new ordnance. However, during the Korean and Vietnam conflicts, Picatinny Arsenal resumed the production and development of explosives, ammunition and mine systems.

In recent years, Picatinny Arsenal's mission has shifted to conducting and managing research development, life-cycle engineering, and support of other military weapons and weapon systems. The facility has responsibility for the research and development of armament items. The Base Realignment and Closure process in 2005 resulted in Picatinny being designated to remain open and take on expansion in mission.

### **2.2 Geology**

Picatinny lies within Green Pond Valley, a glaciated river valley bounded by Green Pond Mountain to the northwest and Copperas Mountain to the southeast. Elevations at Picatinny range from approximately 1,000 feet (ft) above mean sea level (msl) to 700 ft above msl at Green Pond Brook (GPB) at the southern installation boundary. Green Pond Valley is filled with glacially-derived sediments surrounded and underlain by bedrock. The basement rocks are faulted by a series of northeast/southwest trending faults.

### **2.3 Area of Feasibility Study**

The seventeen PICA-sites addressed in this FS are located in Picatinny within Areas D, F, G, H, I, J, K, L, M, and P as designated in the Argonne National Laboratory (ANL) RI Concept Plan (ANL 1991). The RI study sites addressed in the FS are as follows: four sites in Area D (29, 45/39, and 122); six sites in Area F (111, 126, 138, 139, 140, and PICA-209); one site in Area G (PICA-210); ten sites in Area H (55, 62, 64, 98, 100, 127, 128, 129, 130, and 132); 12 sites in Area I (30, 47, 70, 71, 79, 82, 83, 90, 102, 137, 158, and 159); three sites in Area J (1, 2, and 4); one site in Area K (3); five sites in Area L (5, 6, 36, 188, and PICA-200); five sites in Area M (115, 151, 152, 153, and 154); and one site in Area P (78). Area D covers approximately 89 acres and is located in the west-central portion of Picatinny. Areas F and G are situated near the center of Picatinny and cover approximately 77 and 40 acres, respectively. Area H is located southwest of Picatinny Lake along the base of Green Pond Mountain. Area I is located at the approximate center of Picatinny and consists of Picatinny Lake and production and storage facilities located around the shore of the lake. Area J is located south of Lake Denmark in the northeastern portion of Picatinny. Area K is located in a heavily wooded, central portion of Picatinny, and east of Picatinny Lake. Area L is located near the southeast border of the facility and Area M is located on the ridge that constitutes the western boundary of Picatinny. Area P is located at the southwestern corner of Picatinny, southeast of Green Pond Mountain and northwest of GPB. Figure 2-2 presents the location of Areas D, F, G, H, I, J, K, L, M, and P at Picatinny, New Jersey. Figures 2-3 through 2-12 present the specific sites in Areas D, F, G, H, I, J, K, L, M, and P, respectively.

The Army maintains the Army Environmental Database - Restoration (AEDB-R) system [formerly the Defense Sites Environmental Restoration Tracking System (DSERTS)] for organizing all of the sites in the installation restoration program. In this database, the 48 sites covered in this FS are designated PICA-050 (Site 3), PICA-071 (Sites 29 and 45/39), PICA-075 (Sites 36, 47, 102 and 188), PICA-091 (Sites 55, 62, 64, 98, 100, 127, 128, 129, 130, and 132), PICA-108 (Sites 90, 111, 137, 139, 140 and PICA-210), PICA-122 (Site 126), PICA-134 (Sites 30, 70 and 83), PICA-135 (Sites 71, 82, 158 and 159), PICA-136 (Site 79), PICA-162 (Sites 5 and 6), PICA-175 (Sites 115, 151, 152, 153 and 154), PICA-200 (Site 200, grouped as; Building 1037; Buildings 1030 and 1038; Building 1090; Buildings 1414, 1414A, and 1415; and Building 1437) , PICA-209 (grouped as; Building 167; Building 303; Building 426; Building 430; and Building 462A), PICA-008 (Sites 1, 2, and 4), PICA-013 (Site 78), PICA-011 (Site 122), and PICA-107 (Site 138).

### 2.3.1 Topography and Geology of the FS Area

The geology and topography of the FS area are summarized below for each RI Area addressed in this FS.

Area D: Area D is flat with elevations ranging from approximately 695 to 715 ft msl. Surface water runoff is minimal, as precipitation on the golf course and other undeveloped grassy portions of Area D infiltrates into the ground. Storm drains, which lead to Bear Swamp Brook (BSB) before it reaches GPB, control surface water runoff.

Area D geology consists of the Leithsville Dolomite, which is overlain by glacial sediments. Glacial sediments range in thickness from approximately 100 to 250 ft. Recent swamp deposits occur in the northwest portion of Area D and are represented by organic clays and muck up to five ft thick.

Area F: The northwestern and central portions of Area F are essentially flat and lie in the valley region of Picatinny, with an approximate elevation of 690 to 700 ft above msl. Elevations increase to the north and east to approximately 725 to 755 ft msl. Area F is moderately developed with paved, grassy, and marshy areas. Surface water flows from higher elevations to the flatter valley regions and is partially controlled by storm drains in developed areas that drain into GPB or its tributaries.

Area F geology consists of Precambrian Biotite Gneiss, Hardyston Quartzite, and Leithsville Dolomite, which are overlain by glacial sediments. Glacial sediment thickness varies from 40 ft along the northeast boundary of Area F to 90 ft in the center of the valley, with the thickest section of approximately 120 ft in the central portion of Area F, near Building 176. Recent Holocene swamp deposits occur at the surface along the flood plains of GPB and its tributaries and range in thickness from approximately a few feet up to 30 to 35 ft in thickness. Soils and swamp deposits in Area F have been extensively modified by artificial fill as a result of land development and construction activities.

Area G: Area G is situated in a nearly flat valley region of Picatinny between GPB and BSB. The topography in Area G ranges from approximately 690 to 710 ft msl. Surface water runoff in Area G flows directly towards GPB except in the southern portion of Area G where runoff first drains to a wetland area and then towards GPB.

Area G geology consists of the Leithsville Dolomite, which is overlain by glacial sediments. Glacial sediment thickness varies from 60 ft along the northwest boundary

of Area G to 95 ft in the center of the valley. The thickest glacial sediments occur along the southwest boundary of Area G, where the thickness is estimated to be 135 ft. Holocene swamp deposits occur along the flood plains of GPB and its tributaries. These deposits consist of organic silt and clay and range in thickness from approximately a few feet to 30 to 35 ft. The surficial soils and the swamp deposits in Area G have been extensively modified by artificial fill as a result of land development and construction activities.

Area H: Area H is situated in a small valley bounded on the west by Green Pond Mountain and to the east-southeast by a slightly elevated hill. BSB and its associated floodplain transect the center of the valley and flow from northeast to southwest. The highest surface elevations found within Area H are along the slopes of Green Pond Mountain at approximately 750 ft msl near Site 151. Elevations within Area H decrease to the southwest and the lowest elevations within Area H occur near the southern boundary, along BSB. Surface elevations in these areas range from 696 to 707 ft msl. Surface topography slopes from Green Pond Mountain and the elevated hill towards BSB and then down-valley.

Area H bedrock geology consists of four different formations; Green Pond Conglomerate, Leithsville Dolomite, Hardyston Quartzite, and Precambrian Gneiss. In addition, two unconsolidated geologic units were identified in Area H. The first unit is characterized by fine-grained deltaic sediments related to post-glacial alluvium associated with BSB. This sequence contains fine to coarse sand lenses of silt, clay, and occasional gravel stringers. The second unit is classified as unstratified, unsorted glacial till deposited by subglacial drainage. This sequence consists of fine to coarse sand and gravel with trace fines and was identified throughout the area.

Area I: Operations in this area include explosives manufacturing, loading and storage, shell washout, and research and development. Area I also contains the main power generating plant for the arsenal, located on the south shore of Picatinny Lake.

Area I encircles Picatinny Lake and the associated flood plain which is present in the main valley floor. The area is bounded to the northwest by Green Pond Mountain and to the southeast by the unnamed ridge. To both the northeast and southwest of the area, the main valley floor continues. Following regional topographic trends, the elevated ridges slope into the valley floor, and the valley floor then slopes gently to the southwest. Surface water bodies in Area I, which include Picatinny Lake and GPB, act as groundwater discharge areas and drain the installation.

Area J: is located along the unnamed ridge that trends from northeast to southwest along the southeast side of the installation. This area is transected by a small valley that trends from northwest to southeast, perpendicular to the direction of the axis of the ridge on which it is located. Site 2 is located in this valley with Site 1 on the ridge to the northeast and Site 4 on the ridge to the southwest. Elevations within this valley range from 800 to 900 ft msl. The valley acts as a collection area for surface water runoff from the surrounding ridges and is characterized by a series of wetlands, streams, and ponds. Topography of the valley slopes gradually to the southeast, and off of the installation.

This valley is bounded to the southwest and the northeast by two elevated ridges where elevations exceed 1,000 ft msl and 960 ft msl, respectively. The surface topography consists of glacial woodlands present on the elevated ridges of the valley while low-lying swampy marshes dominate the valley floor. Various small streams and drainage ditches transverse the valley floor, which along with a pond and reservoir serve as collection basins for surface water runoff. Various industrial structures, activities, and roadways are present in the valley floor and on the ridges, and have disturbed the topography in the low-lying valley and ridges and the natural pattern of surface water flow and drainage.

Surface water bodies within Area J include several small unnamed streams and drainage ditches which transect the valley floor, low-lying swampy marshes, a small pond (0.3 acre), a 4.5-acre reservoir located within Site 2 (i.e., G-2 Reservoir), and a small gunnite-lined rocket exhaust pond located within Site 4. One small stream, the 1500 Run, enters the area from the southwest. This stream drains surface water from Site 3, which is located to the southwest. The 1500 Run discharges to Stillwell Pond, a 0.3-acre pond located in the center of Site 2. Stillwell Pond discharges to the marshy area associated with the G-2 Reservoir via Stillwell Run. Another prominent surface water feature is Pre-Ames Brook, which enters the area from the north. Pre-Ames Brook drains from Gravel Dam Cove, winds through an undeveloped woodland north of Site 2, and discharges to the marshy area located west of the G-2 Reservoir. However, beaver activity in the G-2 Pond has created a wetland area surrounding most of Pre-Ames Brook. As a result, the brook channel is not distinguishable near the G-2 Pond. Flow from Gravel Dam Cove to Pre-Ames Brook was extremely limited in September 1997, suggesting that the wetland area is due primarily to back-up from the G-2 Reservoir. Most surface water in Area J, except for the rocket exhaust pond, drains east through the valley, where it collects in the G-2 Reservoir for eventual off-site drainage through Ames Brook.

Area K: is located in a heavily wooded area, east of Picatinny Lake. Area K was previously owned and operated by the Department of the Navy and is commonly referred to as Navy Hill. The area is currently active, although its uses have changed over the past 50 years.

An intermittent stream conveys surface water drainage from the far western portions of Area K both overland and through a series of underground pipes and culverts to GPB located to the northwest. The eastern portion of the area is predominantly swampland. As a result, drainage channels have been dug to convey surface water away from structures. Drainage pathways from the area include a stream behind Building 1507, a channel through the berm area of the Building 1505 Test Range, and a channel along the road to the west of the Building 1505 Test Range. These three drainage features converge in a swale between Buildings 1501 and 1504 and ultimately discharge to a 500,000-gallon capacity reservoir, which was created during the 1950s and is located to the north.

Area L: is located near the southeast border of the facility on the gently rising hillside and the unnamed ridge near the Mt. Hope entrance. Area L is bordered by the facility boundary to the southeast, Area F in Phase I to the northwest, and Areas I and K in Phase II to the north.

Area L consists of several different former explosive production, storage and testing areas and contains buildings in the 1000, 1300, 1400, and 3100 number series. The 1000 series buildings were associated with the production of high explosives; 1300 series buildings were associated with nitroglycerin production; 1400 series buildings predominantly supported propellant production; and 3100 series building were used for storage and testing of ordnance items. The majority of the sites within Area L are located within the Mt. Hope enclosure.

Robinson Run, a tributary of GPB, flows westward through the central portion of Area L and serves as the primary surface water discharge point in the central portion of Area L. Robinson Run originates from a spring/seep in a marshy headwaters area proceeds in a westerly direction. An unnamed intermittent tributary originating at Fisher's Pond feeds Robinson Run from the south.

Area M: Area M is located on the ridge that constitutes the western boundary of Picatinny. The ridge is part of Green Pond Mountain. Elevations in Area M vary from 775 ft msl in the southeast and 800 ft msl in the southwest to 1,100 ft msl in the northwest and 1,175 ft msl in the northeast.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

The unconsolidated unit consists of unstratified and unsorted glacial till. The till is described as pebbles and cobbles in a silty fine sand matrix. Based on the glacial geology observed in other ridged areas within Picatinny, the thickness of the glacial strata increases toward the valleys. Glacial deposits are generally thin (<50 ft) on the ridges and may increase to 200–300 ft in the center of the valleys. Swamp deposits occur sporadically in the low-lying areas and are represented by organic clays and muck that are encountered at the surface.

Area P: Area P is located at the southwestern corner of Picatinny Arsenal, with Green Pond Mountain to the northwest and GPB to the southeast. Most of Area P is relatively flat with the exception of the western portion, which is characterized by steep slopes associated with Green Pond Mountain. Elevations range from approximately 685 ft msl in the marshy area to 750 ft msl in the northern corner near Site 94. The majority of the land in Area P (including Site 78) is in swampy low-lying areas with an average elevation of approximately 695 ft msl.

Numerous engineered drainage ditches are present in Area P, which direct storm water runoff from roadways in a southeasterly direction to nearby GPB. Surface water flow in these drainage ditches is often sluggish or stagnant. GPB, the principal drainage feature, flows to the southwest and exits the facility approximately 3000 ft south of the site.

Based on boring information from other wells installed in adjacent areas, the soil thickness is estimated to be between 200 and 250 ft at Area P. The basal unconsolidated sequence is a poorly sorted till consisting of sand, gravel, and boulders in a fine-grained matrix of silts and clays. The lower sequence is overlain by a fine-grained middle sequence consisting predominantly of silt, laminated with very fine to fine sand and clay. The upper sequence coarsens upward from fine sand and silts at the base through medium sand and silt with gravel to medium sand and gravel at the top of the sequence. Swamp deposits occur sporadically in the low-lying areas and are represented by thin layers of organic clays and muck that are encountered at the surface. It has been determined that the swamp deposits formerly had a greater aerial extent in Area P than currently observed; a significant portion of these deposits have been historically excavated in the developed portions of the area and replaced by artificial fill material.

### 2.3.2 Hydrogeology

The principal source of groundwater in the Green Pond Valley is found in the stratified drift deposits filling the valley floor. The low-permeability and the steep slopes of Green Pond Mountain and Copperas Mountain restrict infiltration of precipitation in these mountains. As a result, most precipitation flows overland and into the highly permeable stratified drift deposits in the valley center. The small amount of precipitation that enters Green Pond and Copperas Mountains flows down through shallow fractures to the glacial sediments in the valley.

The principal aquifers in the Picatinny region are located in stratified drift deposits found in the valley areas. Production wells in the stratified drift average 500 gallons per minute in the general area surrounding Picatinny. Conversely, the bedrock aquifer is infrequently used for production wells because of limited fracture occurrence and generally low hydraulic conductivity. Regionally, fractures in the Precambrian basement present an important, yet limited, groundwater source, particularly where the glacial stratified drift deposits are thin or non-existent. As bedrock groundwater production is fracture-controlled and highly variable, yield from large-diameter wells in the bedrock average less than 100 gallons per minute. However, domestic bedrock wells that yield only a few gallons per minute are common in the region.

### 2.3.3 Wetlands and Floodplains

Area D: None of the four Area D sites (PICA-011/Site 122, PICA-071/Site 29, and PICA-071/Site 45/39) is located within a wetland specified by the National Wetland Inventory (NWI) or in the 100-year floodplain specified by the Federal Emergency Management Agency (FEMA).

Area F: Of the six study sites in Area F, three sites are located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI map: PICA-108/Site 139, PICA-108/Site 140, and PICA-209/Site 209. PICA-108/Site 111, PICA-122/Site 126, and PICA-107/Site 138 are not located within a wetland or wetland buffer. None of the six sites are located within the 100-year floodplain specified by the FEMA.

Area G: The one site in Area G (PICA-108 (210)/Site 210) considered in this FS is not located within the 100-year floodplain or within a wetland or wetland buffer zone.

Area H: Of the ten study sites in Area H considered in this FS, three sites are located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

map: PICA-091/Site 64, PICA-091/Site 130, and PICA-091/Site 132. None of the Area H sites is identified within the 100-year floodplain.

Area I: Of the twelve study sites in Area I considered in this FS, none of the sites are located within the 100-year floodplain. One site within Area I is located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI map: PICA-135/Site 158.

Area J: Of the three study sites in Area J considered in this FS, two sites are located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI map: PICA-008/Site 2 and PICA-008 (157)/Site 4. None of the Area J sites are located within the 100-year floodplain.

Area K: No sites in Area K are located within a wetland, wetland buffer zone, or the 100-year floodplain.

Area L: Of the five study sites in Area L, one site is located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI map: PICA-200/Site 200. None of the Area L sites are located within the 100-year floodplain.

Area M: None of the five study sites in Area M are located within a wetland or wetland buffer (within 50 ft of the wetland) as shown on the NWI map, or within the 100-year floodplain specified by the FEMA.

Area P: The one site in Area K considered in this FS is located within a wetland or wetland buffer zone: PICA-013/Site 78. This site is not located within the 100-year floodplain.

### **3. Site Summaries**

The following sections present the site history, summaries of previous investigations, nature and extent of contamination, and risk assessment results for each of the 45 study sites addressed in this FS. The current and anticipated future land use of these sites is military/industrial. For the purposes of discussion in the RI/FS the following screening criteria (SC) were used:

- For soils, the promulgated NJDEP Non-Residential Soil Remediation Standards (NRSRS) were used as the preliminary SC. In the absence of state criteria, the USEPA Industrial Regional Screening Levels (IRSLs) were used as SC. If the Picatinny-specific background value was higher than the selected guidance criteria, the background value was selected as the SC.
- For sediments, the lower of the Interim Sediment Quality Guidelines (ISQGs), New York Sediment Criteria, and Sediment Quality Benchmarks (SQBs) were used as SC. In the absence of the aforementioned guidance values, the effects range low (ER-Ls) from NJDEP were used. If there were also no ER-Ls, the lower of IRSL and NRSRS were selected for the preliminary SC. If the Picatinny-specific background value was higher than the selected guidance criteria, the background value was selected as the SC.
- For surface water, the promulgated New Jersey Surface Water Quality Criteria were selected as the preliminary SC. If state criteria were absent, the USEPA Water Quality Criteria were selected as the preliminary SC. Only in the absence of water quality criteria was the USEPA Tap Water (1E-06) Risk Screening Level (RSL) selected as the SC. If the Picatinny-specific background value was higher than the selected guidance criteria, the background value was selected as the SC.
- For groundwater, the lower of the New Jersey Groundwater Quality Standards (GWQS) (or the Practical Quantitation Limit if higher), the New Jersey Maximum Contaminant Levels (MCLs), the Federal MCLs; or the Federal non-zero Maximum Contaminant Level Goals (MCLGs) were used as SC. If none of these were available, Federal Health Advisories or USEPA RSLs for Tap Water were used as screening criteria. Environmental conditions related to groundwater at some of these sites are addressed on an area-wide basis in the Mid-Valley ROD report (ARCADIS 2009b) or in the Area D Record of Decision (ROD) (USEPA 2004a).

The preliminary SC and regulations considered during development of soil, sediment, surface water, and groundwater SC are summarized in Appendix B. Note that for the purposes of the risk assessment screening was conducted in accordance with Risk Assessment Guidance for Superfund (RAGS).

### **3.1 PICA-050/Site 3 – Former Reaction Motors/ Rocket Fuel Test Area, 1500 Series Buildings**

#### 3.1.1 Site History

PICA-050/Site 3, as shown in Figure 3-1, is located in Area K east of Lake Denmark Road off of Hart Road. Site 3 is situated in a heavily wooded area along the ridge that trends along the southeastern boundary of Picatinny Arsenal (PTA), and surface topography slopes slightly towards the northeast. The eastern portion of the site is predominantly swampland, characterized as freshwater forested or shrub wetlands. Drainage pathways have been dug to keep surface water away from building structures, and the channels ultimately drain northeast to the 1500 Reservoir. Groundwater is assumed to flow northeast, toward the G-2 Pond in Area J (Shaw 2004a). This site consists of two groups of buildings: the Western Explosives Area and the Eastern Pyrotechnics Area.

#### The Western Explosive Area

The Western Explosive Area is comprised of buildings 1500 to 1508. The majority of the buildings were constructed of steel-reinforced concrete in the late 1940s, and they are surrounded on three sides by blast-protective, earthen berms. The western area of Site 3 was used for the large-scale storage, production, conditioning, loading, and testing of pyrotechnics, explosives, and solid rocket propellants from 1947 through the early 1960s. Rocket propellants powder was stored in Building 1501, conditioned in Buildings 1502 and 1503, loaded in Building 1506, and tested in Building 1505 Test Range.

From 1960 to the present, Building 1501 has been used as an office, and as an instrumentation and machine shop. Cutting oil and acetone are used in this building. Building 1502 operates as a storage (heating and refrigeration) facility. Building 1503 continues to serve as an explosives conditioning facility. Building 1504 is a storage and field office where depleted uranium (DU) and radioactive waste were reportedly stored. Building 1505 is the control center for propellant testing at the Building 1505 Test Range. The test range is composed of six concrete test bays (Buildings 1505-A

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

through 1505-F) and storage structures (buildings 1505-H through 1505-K). Building 1505-G has been demolished. The last reported use of the test bays are field testing various high explosives and projectiles, machine guns, propellants, and igniter/fuze assemblies. Specific materials used within the test range include: high explosives such as nitroglycerine, cyclo-tetramethylene tetranitramine (HMX), and cyclo-trimethylene trinitramine (RDX); oxidants such as nitrates, vinyl acetate, polystyrene and epoxy; and metals such as beryllium, DU, lead, aluminum, magnesium, titanium, niobium, molybdenum, and zirconium.

Building 1506 was used for explosives loading. Acetone, dimethyl phthalate, cobalt, black powder, black lacquer, and methyl ethyl ketone are documented as supporting Building 1506 operations. Buildings 1507 and 1507B were last reported as being used for storage of explosives, while Building 1508 is used for the storage of photographic chemicals/hazardous wastes.

The last reported use of the Western Explosives Area is for storage, assembly, and research and testing of high explosives, propellants, and projectiles. There are two transformer pads in the Western Explosives Area, one located near Building 1502 and one near Building 1504. According to the PTA transformer database, three of the six transformers near Building 1502 were removed in August 1990. The remaining transformers in this area were not polychlorinated biphenyl (PCB)-contaminated.

### Eastern Pyrotechnics Area

The Eastern Pyrotechnics Area consists of Buildings 1509 to 1515 and Building 1530. They were constructed of brick and concrete in the early 1950s. Liquid fuel missiles were tested in the buildings of this area until 1958. After 1958, additional buildings were constructed for the mixing, pressing, and filling of various pyrotechnic compounds into flares, fuzes, and primers.

According to PTA personnel, Building 1509 had a furnace room and two bays where motors were tested. Motor testing was ceased on 1956. In the past, process wastewater from Building 1509 was conveyed to floor and sink drains. In 1982, 25 gallons per week of wastewater was conveyed to the sewers through drains in Building 1509. During the site inspection in 1993, Building 1509 housed a wet/dry pyrotechnics mixing operation. Waste currently generated at building 1509 include Class B pyrotechnics, waste oils and rags, barium chromate, nitrate, and contaminated metals components.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

Building 1510 is used as an administrative office building for the Pyrotechnic System Branch of the energetic and Warheads Division. The building is also utilized for inert storage and assembly and houses a strain gage laboratory. Accessory buildings 1510A and 1510B are used for the storage of energetic and pyrotechnic equipment, Building 1510D is an inactive sentry station.

Building 1511 was used to test burning rates of pyrotechnics. Storage of radioactive materials is reported to have taken place at this building in the early 1960s. A fuming nitric acid tank reportedly existed in the building from 1956 to 1973. Interviews with PTA personnel indicate that Thorium-232 was stored in the lower level of either Building 1511 or 1512 for a short period of time in the 1960s. Building 1511 incurred structural damage from seepage of creek water into the basement. The building was approved for demolition in 1984. However, the building remains standing at this time.

Building 1512 was reportedly to be used as an office and photography lab. The building is currently a small-scale chemistry and holography lab. Photographic chemicals, mercury, acetones, sodium nitrate, potassium perchlorate, methanol, Class 7 loose pyrotechnics, and powdered metals are among the compounds used at this building. The last reported waste stream from Building 1512 consists of photographic fixer and developer, waste oils, and ethylene glycol. Accessory Building 1512A is used for the storage of gas cylinders, while Building 1512B is a magazine.

Building 1513 was used as storage of various compounds including thorium nitrate, nitrocellulose, black powder, tetranitrocarbazole, M53 Composite, crush pellets, perchlorates, chlorates, zirconium, titanium, tri-isobutyl-aluminum, aluminum sesquichloride, dimethyl zinc, lithium, magnesium, and sodium. Several spills have occurred within this building including a spill of thorium nitrate. Spills were swept up and disposed at the PTA Burning Ground; however, there are not records that decontamination activities were performed in this building. In 1993, the entrance to the building was restricted due to chemical and metal dust inhalation hazards.

Building 1514 has five rooms, one of which is a 90-day hazardous waste storage area for solvents. In 1976, equipment was installed in Building 1514 for the manufacture of triethylaluminum (TEA), but mass production was not allowed, and equipment was decontaminated and partially removed. Building 1514 is currently used for the storage of a wide range of inorganic and organic laboratory chemicals.

Building 1515 was apparently used as a test bay for testing unknown materials, including radioisotopes. Currently, Building 1515 contains offices, a lab for testing

flares and pyrotechnic materials, and a flare-burning tunnel. An inventory of chemicals stored and/or used at Building 1515 listed 600 known and 30 unknown chemicals, including radioactive isotopes and auramine hydrochloride.

Building 1530 houses the Pyrotechnic System Branch's Chemistry and Physical Radiation Section. The building includes various laboratories and a photographic room. Lithium-sulfur dioxide batteries, aluminum and iron scraps, and waste oil from machine shop operations were among the wastes generated at this building. In 1991, all hazardous waste operations were ceased at the building. On 25 March 1998 a 3,000-gallon underground storage tank (UST) of fuel oil adjacent to Building 1530 was removed as part of the Tank Closure and Site Assessment for UST-13, Building 1530. Approximately 25 cubic yards of contaminated soil were removed from excavation. Post-excavations samples were collected and did not present any exceedances of the NJDEP cleanup criteria. A closure report for this UST was submitted to NJDEP in September 1998. Sanitary sewer lines were installed in the Eastern Pyrotechnics Area in the late 1960s. PTA dye tests confirm that, before that time, wastewater was conveyed from the buildings through floor and sink drains to either a dry well and septic field located east of Building 1530 or the swamp area on the east side of Building 1515. From the swamp area, a drainage channel conveys surface water to the reservoir located to the north. The dry wells and septic field were removed prior to paving of the parking lot area for Building 1530.

There are currently no plans for future construction at PICA-050/Site 3.

### 3.1.2 Previous Investigations

Six investigations have been conducted at Site 3: 1980 - PTA Surface Soil Investigation at the Western Explosive area; 1983 to 1985 - U.S. Army Environmental Hygiene Agency (USAEHA) Site Investigation of the Eastern Explosives Area; 1989 Site Investigation of the Western Explosives Area; 1996 - Round 1 of the Phase II RI; 2001 PTA Tank Removal Investigation (Shaw 2004a) and 2003 Shaw Sump and Dry Well Investigation (Shaw 2005a). Figure 3-2 depicts the known sampling locations for these investigations.

As part of the PTA Surface Soil Investigation, 7 soil samples and a small quantity of surface stones were collected in 1980. Samples were collected from a 10,000 square ft area southeast of Test Bay 1505-E where projectiles containing depleted uranium and beryllium were test fired. A background sample was collected upgradient and west of the area, and uranium-contaminated debris was removed from the area.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

During the USAEHA Site Investigation, monitoring well MW-O was sampled four times: one time in 1983 and three times in 1985. Samples were analyzed for volatile organic compounds (VOCs) and metals during the first sampling event, and for metals in the subsequent sampling events. The monitoring well was located hydraulically downgradient of the Eastern Pyrotechnic area.

During the 1988 to 1989 Investigation of the Western Explosives Area, four soil and four surface water/sediment samples were collected in the area of the Building 1505 Test Range. All of the samples were analyzed for chromium, barium, sulfate, nitrocellulose, nitrite, and nitrate. Additional soil sampling was performed in the area of Building 1505-F Test Area in response to a PTA Division of Engineering Housing (DEH) request to determine the possible lead contamination in the firing ranges.

In autumn of 1995, asbestos-containing soil was excavated from an area around Building 1505 and its satellite offices.

The Phase II Round 1 RI sampling activities were conducted at Site 3 from May 1995 to November 1996. Sampling for the Phase II Ecological Risk Assessment (ERA) took place from May through December 1998. Additional sampling for the Phase II RI was conducted between February 2000 and January 2002. The sampling program included:

- Conducting a radiological survey;
- Collecting 11 surface soil samples for off-site analysis and 22 surface soil samples for on-site analysis;
- Drilling one soil boring and collecting one subsurface soil sample for on-site analysis;
- Collecting six subsurface soil samples at three surface soil locations for on-site analysis;
- Collecting 16 surface water samples;
- Collecting 19 sediment samples;
- Installing eight monitoring wells and collecting 10 subsurface soil samples for off-site analysis and 22 subsurface soil samples for on-site analysis;

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Installing five HydroPunch™ borings for groundwater analysis;
- Sampling, performing aquifer testing, and surveying the eight newly installed monitoring wells;
- Conducting two surface soil bioassays, four surface water bioassays, and six sediment bioassays;
- Analysis of earthworm and fish tissue samples; and
- Conducting a macroinvertebrate survey and a fish survey.

On 1 June 2001, a 1,500-gallon capacity gasoline UST (Picatinny UST ID #134), located adjacent to the northern side of Building 1504A, was removed by PTA along with approximately 124 tons of petroleum-contaminated soil. A total of 980 gallons of waste liquid material were removed from the tank. The final excavation had an approximate area of 520 square ft and an average depth of 7.5 ft. Nine post-excavation soil samples were collected and analyzed for total petroleum hydrocarbons (TPHs), and one of the samples was also analyzed for VOCs. Results did not indicate any chemical compounds at concentrations that exceed the SC. The closure report for this UST was prepared and submitted to NJDEP, under case # 01-06-01-1424-39.

As part of the Sumps and Dry Wells Investigation (Shaw 2005a) a 4 square ft-area behind Building 1504A was excavated to a depth of 2.5 ft in 2003. Two post-excavation soil samples were collected: one sample was collected from the bottom, and one was collected from the sidewall of excavation. The post-excavation soil samples were analyzed for semi-volatile organic compounds (SVOCs), pesticides, and inorganics. One sample was collected from the excavated soil pile and analyzed for explosives and inorganics. Screening criteria were not exceeded in any of these soil samples, and the soil was replaced to restore the excavation to the original grade.

### 3.1.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-2 shows the location and concentrations where one or more constituent exceeded the SC.

In surface soil, only two constituents (one SVOC and one metal) were detected at concentrations that exceed their respective SC. Benzo(a)pyrene was detected at a

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

concentration exceeding the SC (0.2 milligrams per kilogram [mg/kg]) in one surface soil sample from location K-3-SS-009A, at a concentration of 0.66 mg/kg. Arsenic was detected at a concentration exceeding the SC (19 mg/kg) in one surface soil sample from K-3-MW004, at a concentration of 22 mg/kg. No other parameters were detected in surface soil in concentrations exceeding their respective SC. There were no concentrations of any constituent in subsurface soil samples that were greater than their respective SC.

As mentioned in the previous section, an investigation was conducted to determine the contamination at the former dry wells and septic system area prior to placement of asphalt for a parking lot near Buildings 1504 and 1504A. During Round 1 for Phase II RI, Sample K-3-SP-001 was collected from the suspected former location of the dry well. Lead and other metals were detected at concentrations exceeding their respective SC; however, additional samples were collected to delineate the extent of the contamination including two surface soil samples (K-3-SS-010 and K-3-SS-011) and one subsurface sample K-3-SB-001. In 2003, the area was excavated as part of the PTA Sump and Dry well Investigation. No SC were exceeded in the post-excavation and waste characterization samples. Therefore, the soil was replaced, and the area capped with asphalt for the parking lot.

In sediments, one VOC (toluene) was detected at a concentration greater than its respective SC (0.05 mg/kg) at location K-3-SD-009, at a concentration of 0.15 mg/kg. The following maximum concentrations of SVOCs were all detected at location K-3-SD-017 (0-1 ft.): 0.10 mg/kg 2-methylnaphthalene (SC = 0.0202 mg/kg), 0.87 mg/kg acenaphthene (SC = 0.00671 mg/kg), 0.98 mg/kg anthracene (SC = 0.03162 mg/kg), 1.40 mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 1.70 mg/kg benzo(a)pyrene (SC = 0.0319 mg/kg), 2.50 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 0.52 mg/kg benzo(g,h,i)perylene (SC = 0.29 mg/kg), 0.73 mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 2.10 mg/kg chrysene (SC = 0.0571 mg/kg), 4.10 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.60 mg/kg fluorene (SC = 0.0212 mg/kg), 0.64 mg/kg indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg), 0.25 mg/kg naphthalene (SC = 0.03275 mg/kg), 4.1 mg/kg phenanthrene (SC = 0.0419 mg/kg), and 4.50 mg/kg pyrene (SC = 0.0530 mg/kg). Maximum concentration of one SVOC, 0.14 J mg/kg dibenz(a,h)anthracene (SC = 0.00622 mg/kg), was detected at the same location, from 1 to 2 ft.

No explosives were detected at concentrations that exceeded their respective SC in any sediment samples. One sediment sample, location K-3-SD-012, had a detection of the pesticide Mirex at a concentration of 1.60 mg/kg, which exceeded its SC (0.007

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

mg/kg). Concentrations of constituents in sediment samples collected upstream and downstream of the swampy area east of Building 1515 were less than respective SC, indicating that contamination in sediments was confined to the swampy area. The maximum concentrations of metals in sediment samples at Site 3 include the following: 2740 mg/kg manganese (SC = 1673 mg/kg) and 54 mg/kg strontium (SC = 16 mg/kg) at sample location K-3-SD-010A (0 to 1 ft.); 54.70 mg/kg chromium (SC = 37.3 mg/kg) at sample location K-3-SD-011 (0 to 1 ft.); 0.66 mg/kg mercury (SC = 0.249 mg/kg) at K-3-SD-014 (0 to 1 ft.); 58.2 mg/kg copper (SC = 28 mg/kg) at sample location K-3-SD-017 (0 to 1 ft.); 2.86 mg/kg cadmium (SC = 1.7 mg/kg), 249 mg/kg lead (SC = 38.8 mg/kg), 15.90 mg/kg silver (SC = 1 mg/kg), and 239.00 mg/kg zinc (SC = 171 mg/kg) at sample location K-3-SD-018 (0 to 0.5 ft). No other constituents were identified in sediment with concentrations greater than the SC.

In surface water samples, one SVOC, bis(2-ethylhexyl)phthalate, was detected at concentrations greater than its SC (1.2 micrograms per liter [ug/L]) in two surface water samples: 25.00 ug/L at K-3-SW-012 and 33.00 ug/L at K-3-SW-017. The explosive 2,4 dinitrotoluene (DNT) was detected at concentrations greater than its SC (0.11 ug/L) in three samples: 0.20 ug/L at K-3-SW-001, 0.18 ug/L at K-3-SW-005, and 0.12 ug/L at K-3-SW-006. One anion was detected at a concentration greater than its respective SC in surface water: 13,000,000 ug/L of sulfate (250,000 ug/L) at sample location K-3-SW-004. It should be noted that the detection of sulfate was in 1988, and sulfate was not detected in a sample from the same location in 1996.

Eleven metals were detected in surface water samples at one or more locations at concentrations greater than their respective SC. The following maximum concentrations of metals were detected at location K-3-SW-018: 18,600 ug/L aluminum (SC = 200 ug/L), 4.50 ug/L arsenic (SC = 19 ug/L), 46 ug/L chromium (SC = 37.3 ug/L), 21,000 ug/L iron (300 ug/L), 23 ug/L lead (SC = 38.8 ug/L), 0.23 ug/L mercury (0.249 ug/L), and 380.00 ug/L zinc (171 ug/L). The maximum concentration of manganese (SC = 50 ug/L) was detected at K-3-SW-006 at a value of 1570 ug/L. Concentrations of constituents in surface water samples collected upstream and downstream of the swampy area east of Building 1515 were less than respective SC, indicating that contamination in surface water was confined to the swampy area. No other constituents were identified in surface water with concentrations greater than the SC.

One groundwater sample, K-3-MW-005, had a detection of a VOC, methylene chloride, a common laboratory contaminant, above its SC (3 ug/L), with a concentration of 4.00 ug/L. The explosive RDX (SC = 2 ug/L) was detected in samples from two locations,

with a maximum concentration of 99.20 ug/L at location K-3-MW-002, in October of 1996. However, the concentration of RDX at K-3-MW-002 in May of 2000 was 8.1 ug/L, and a nearby hydropunch sample collected in March of 2000 had a concentration of 12 ug/L RDX. There were also no detections of RDX in downgradient wells or surrounding sites, indicating the high concentration detected in 1996 was an isolated occurrence. RDX was not detected above the SC in any soil samples at Site 3, and or above the SC in groundwater samples from surrounding wells. One radiological parameter was detected above its SC (5 picocuries per liter [pCi/L]), 7.56 pCi/L radium-226 at location K-3-MW-006. Nine generally naturally occurring metals were detected in groundwater samples at one or more locations at concentrations greater than their respective SC.

The maximum concentrations of metals in groundwater were detected in the duplicate sample from location K-3-HP-009; the following values are the maximum concentrations detected for each constituent: aluminum (SC = 200 ug/L) 120,000 J ug/L; arsenic (SC = 3 ug/L) 38.00 J ug/L; chromium (SC = 70 ug/L) 220.00 J ug/L; iron (SC = 300 ug/L) 170,000 J ug/L; lead (SC = 5 ug/L) 130 J ug/L; manganese (SC = 50 ug/L) 4600 ug/L; nickel (SC = 100 ug/L) 120 J ug/L; thallium (SC = 0.5 ug/L) 8.00 J ug/L. Samples collected from monitoring wells 3MW-3 and 3MW-7 exceeded SC concentrations for aluminum, iron and manganese. Arsenic was also detected in 3-MW-3 above the SC. Aluminum, iron, manganese, nickel, and thallium are naturally occurring constituents, which are commonly identified at elevated concentrations in groundwater throughout PTA. No other constituents were identified in groundwater with concentrations greater than the SC. Lead was detected in groundwater in several samples from surrounding sites, at concentrations slightly greater than the SC.

### 3.1.4 Summary of Risk Assessments

#### 3.1.4.1 Human Health

An HHRA for Site 3 receptors were previously provided in the Phase II RI, Additional Investigation Report (Shaw 2004a). The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 3 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Future Industrial Research Worker (chemical risks): carcinogenic risk number of  $2E-06$ / noncarcinogenic hazard index (HI) of  $<1$ .
- Future Construction Excavation Worker (chemical risks): carcinogenic risk number of  $4E-07$ / noncarcinogenic HI of  $<1$ .
- Future Construction Excavation Worker (radiological risks): carcinogenic risk number of  $2E-06$ .

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- On-site Youth Visitor (chemical risks): carcinogenic risk of  $4E-06$ / noncarcinogenic HI  $<1$ .
- On-site Youth Visitor (radiological risk): carcinogenic risk of  $6E-06$ .

### 3.1.4.2 Lead Blood Model Results

The current and reasonably anticipated future use scenarios at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the preliminary remediation goal (PRG) revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial Worker (surface soil): Lead was not selected as contaminant of potential concern (COPC) in this medium.
- Current Construction Excavation Worker (subsurface soil): Lead was not selected as COPC in this medium.

In addition, human health risks associated with lead exposures for hypothetical use scenarios not reasonably anticipated are:

- Current On-site Youth Visitor (sediment): No concern – the average lead concentration of 69 mg/kg is less than the calculated PRG of 1,496 mg/kg.

#### *3.1.4.3 Ecological*

Site 3 was evaluated in the Phase II ERA. Bioassays were performed, tissue composites analyzed, and an aquatic biota survey conducted. Samples water bioassays exhibited decreased growth of the test organisms when compared to laboratory control and reference samples. Sample 3-SW-19 showed mortality of 100%, however, additional sampling did not corroborate these results and it was thought that the toxicity observed in the site samples could be associated with natural conditions at PTA. Some differences in survival were observed in two of the five site sediment bioassays. Overall, the sediment did not appear to be highly toxic and suggests only limited contamination. Surface soil bioassay did not exhibit a significant change in the earthworm survival rate. Tissue analysis indicated the possibility for chemical consumption but it does not appear to impact the organism.

A macroinvertebrate survey conducted on the small streams in the 1500 Building area indicated minor perturbations at several locations; however, the study concluded that as a whole, the water and sediment quality appear to be of good quality to support benthic and fish populations.

Although ecological impairment was not observed in the benthic surveys, other lines of evidence (elevated contaminant concentrations, contaminants in tissue, and surface water and sediment toxicity) may suggest potential ecological impacts. However, the likelihood of actual impacts to the local ecological community is small given the industrial nature of the site and the proximity and relatively low levels of the soil contamination near the structures on the site which consists of industrial buildings and range activities. Therefore, active remedial action is not necessary to address these potential ecological risks.

#### *3.1.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military /industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site; and

- Ecological risks are expected minimal and limited to localized areas.

For hypothetical risk scenarios that were evaluated (On-site Youth Visitor), both chemical and radiological risks are within the generally acceptable risk range of 1E-06 to 1E-04. No residential use risk scenarios were evaluated.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.2 PICA-071/Site 29 - Yard Drum Storage Area (Bldg 31 Yard)**

#### 3.2.1 Site History

PICA-071/Site 29 – Yard Drum Storage Area is a former drum storage area located in an outside courtyard between Wings 1 and 2 near the northwestern corner of Building 31. Building 31 is located at the intersection of Third Avenue and Fourth Court. As stated in the Phase I RI Report (Dames and Moore 1998), the Building encompasses 87,074 square ft, and was constructed in 1943. Building 31 has two stories and was constructed on a concrete foundation. Building 31 consists of five wings with three courtyards, which are concrete, asphalt pavement, and/or gravel. Building 31 is surrounded on all four sides by paved roads. A general layout of Site 29 is shown in Figure 3-3.

Building 31 was a metal workshop containing various types of equipment including lathes, milling machines, and drill presses. Operations of these machines generated waste cutting and machine oils, which were collected in 55-gallon drums that were stored in the courtyard between Building 31 Wings 1 and 2 on a gravel pad measuring approximately 60 ft by 75 ft. Metals shavings coated with cutting oil were also generated and stored in dumpsters in the court yard area. The waste oils were manually transferred from the drums to a 10,000-gallon UST located at the Yard Drum Storage Area. In 1991, the UST was removed as part of Resource Conservation and Recovery Act (RCRA) closure activities (Dames and Moore 1998).

An oil sump and associated gutter is located at Site 29 and it is located opposite to the former oil house within this courtyard. The pit has a capacity to hold approximately 150 gallons of oil and it is connected to a storm drain that ultimately discharges to BSB. The

sump was designed to capture surface water runoff from the Drum Storage Area (Environmental Compliance, Inc. [ECI] 2005a).

According to the information from the safety office files, a complaint was filed in July, 1970 regarding oil pollution in GPB and BSB. The complaint suggested that the oil originated from the Yard Drum Storage Area, and it was thought that during large rainfall events oil was carried to the storm drain in the Yard Drum Storage Area (Building 31 Yard) which flowed to BSB. In response to the complaint, oil residue in puddles within the Yard Drum Storage Area was removed with oil-absorbent materials. The conclusions drawn in the complaint, however, were never substantiated by an investigation.

The monitoring wells relevant to Site 29 are 31-2, 31-2A, 31-4, 31-5, 31-6/6R, 31-7, and 31-9 (Figure 3-4). Monitoring well 31-6 was found to have approximately two ft of light non-aqueous phase liquid (LNAPL) in June 1995 (Imbrigiotta and Rice 1997). The LNAPL was analyzed and found to be motor oil. This oil is believed to be a onetime spill into the well. A onetime bailing event in November of 1996 yielded 2.5 liters of LNAPL, and from 1996 to 1999, five additional liters of oil were recovered from 31-6 using passive techniques (ECI 2005a). Monitoring well 31-6 was abandoned in 2003 (ECI 2005b). An excavation centered around monitoring well 31-6 was completed in June 2004, in which approximately 335 tons of TPH impacted soil were removed. Approximately 600 pounds of Oxygen Releasing Compound (ORC®) was mixed with the backfilled soil above and below the water table in order to assist with the degradation of any residual hydrocarbons. Monitoring well 31-6R (replaced 31-6) was installed downgradient of remedial activities to gauge effectiveness of the remedy. No LNAPL was detected at this location during gauging activities conducted in September and December of 2004.

Building 31 was last used as an Armament Software Center. The Picatinny Master Plan was reviewed, and there are no current plans for construction in this area.

### 3.2.2 Previous Investigations

Five investigations have taken place at Site 29: 1986 Soil Investigation; 1989 Site Investigation; 1991 RCRA closure Verification Investigation; 1999 Phase I RI; and 2000 Phase II RI. Additional investigations have been conducted at Building 31 to address other potential areas of contamination in addition to Site 29. The historical sampling locations are shown in Figure 3-4.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

During the 1984 -1986 Soil Investigation (Argonne National Laboratory [ANL] 1991), discolored soil was identified in the drum storage yard. Upon removal of an asphalt pad covering a small portion of the yard in 1984, visible contamination was observed indicating that spills had occurred prior to placing the asphalt pad. In June 1986, approximately 60 cubic yards of soil were excavated and disposed offsite (Gaven 1986; Anderson 1988a). A leaking 10,000-gallon fuel oil UST was removed during this investigation, as well; however, this UST was located in the northeastern corner of Building 31, outside of the Site 29 boundary. Post excavations samples were analyzed for TPH. The removal was approved by NJDEP (Anderson 1988b).

As part of the 1989 Site Investigation (Dames and Moore 1989), ten shallow surface soil samples (0.5 ft to 1 ft below ground surface [bgs]) were collected (D-29-SS-001 to D-29-SS-010) in order to investigate the potential soil contamination resulting from waste spillage associated with the storage of drums onsite. The locations of these samples are shown on Figure 3-4. The locations sampled included the area around the fill pipe of the excavated 10,000-gallon UST, the area around former dumpsters containing oil-coated metallic shavings, as well as miscellaneous areas of discolored soil that may have represented spillage from the stored drums. Samples were analyzed for VOCs, base neutral and acid extractable compounds (BNAs), cyanide, total phenols, oil and grease, and metals (Dames and Moore 1989).

During the 1991 RCRA closure Verification Investigation, additional sampling was conducted at Site 29 in association with the excavation of the 10,000-gallon UST used for storage of machine oil and waste cutting oils. Six soil samples (31-T-S-1 through 31-T-S-6) and one duplicate (31-T-S-6D) were collected and analyzed for VOCs, metals, and toxicity characteristic leaching procedure (TCLP) metals. Two of the samples (31T-S-3 and 31T-S-5) were also analyzed for BNAs and TPHs. Additionally, eleven soil samples were collected from three soil borings (31-S-1 through 31-S-3), which were advanced in the Yard Drum Storage Area to assess potential subsurface contamination. Samples were collected from the surface (0 ft to 2 ft bgs) and at two-foot intervals thereafter to a depth of six (boring 31-S-2) or eight ft. One interval of the 31-S-2 boring had poor recovery, which is why no 31-S-2C sample was collected. Samples were analyzed for VOCs, metals, TCLP metals, and PCBs.

In 1995 and 1996, sampling was conducted to the north of Site 29 to delineate LNAPL that was discovered in monitoring well 31-6. A finger print analysis on the LNAPL from the well suggested the contamination was motor oil.

In the Revised Phase I & II RI Report from April 2005, Buildings 31 and 33 (and the surrounding areas) were investigated. As a component of these investigations, three soil borings (B-30-B-32) were advanced around an oil sump located in western portion of the Site 29 courtyard. The sump has a 150 gallon capacity. Soil samples were collected from two intervals per boring: one at six inches below the sump (3.5 ft bgs) or at the highest photoionization detector (PID) reading, and one six inches above the water table. The soil samples were analyzed for VO+10, BN+10, target analyte list (TAL) metals, PCBs, and TPH. Additionally, four soil borings (B-33-B-36) were advanced in the area of the former PCB-contaminated soil storage area. Soil samples were collected from each boring at 0-0.5 ft bgs and 0.5-1 ft bgs. The samples were analyzed for PCBs and TPH. As part of the Phase II RI, three additional soil borings (2B-1-2B-3) were advanced. Two samples were collected at the 0-0.5 ft bgs and two were collected at the 1.5-2 ft bgs depth from 2B-1 and 2B-2. One sample was collected from the 1.5-2 ft bgs interval from boring 2B-3. Samples were analyzed for PCBs.

The entire Site 29 courtyard was capped with an 8-inch thick concrete slab at the conclusion of the Phase II activities in 2002.

Three groundwater monitoring wells were installed in the Site 29 courtyard, including wells 31-2, 31-2A, and 31-7, as a part of the ongoing groundwater investigation in Area D. TCE has been detected in Area D groundwater since the 1980s. A comprehensive dataset (sampling 53 wells in Area D) was conducted in November of 1991. During the Phase I RI, the majority of wells in Area D were sampled in three rounds: October 1993, April 1994, and July 1994 (Dames and Moore 1998). Groundwater at Site 29 is addressed through the Area D Groundwater ROD (USEPA 2004a).

### 3.2.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-4 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soils, one sample (D-29-SS-008) had an SC exceedance for benzo(a)pyrene with a concentration of 0.3 mg/kg (SC = 0.2 mg/kg). Another sample (D-29-SS-006) had an SC exceedance for chromium with a concentration of 950 mg/kg (SC = 200 mg/kg). No other constituents were detected in surface soil in concentrations that were greater than the SC. No constituents were detected in concentrations greater than SC for subsurface soils. As noted above, the entire Site 29

courtyard has been capped with a concrete slab. Therefore, the exposure pathway to any potential surface soil contamination has been removed.

One sediment sample was collected in the Site 29 area in 1999. Several SVOCs were detected at concentrations greater than the SC including: 0.08 J mg/kg acenaphthene (SC = 0.00671 mg/kg), 0.12 J mg/kg anthracene (SC = 0.03162), 0.48 J mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 0.40 J mg/kg benzo(a)pyrene (SC = 0.0319 mg/kg), 0.56 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 0.19 J mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 1.19 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.06 fluorene (SC = 0.0212 mg/kg), 0.24 mg/kg indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg), 0.56 mg/kg phenanthrene (SC = 0.0419 mg/kg), 0.8 mg/kg pyrene (SC = 0.053 mg/kg). One PCB was identified that had concentration greater than the SC (0.06 mg/kg): 0.09 mg/kg Aroclor 1254. Three pesticides were found to have concentrations greater than the SC including: 0.96 NJ mg/kg 4,4'-dichlorodiphenyldichloroethane (DDD) (SC = 0.00354mg/kg), 0.4 NJ mg/kg 4,4'-dichlorodiphenyldichloroethylene (DDE) (SC = 0.00142 mg/kg), and 0.09 NJ mg/kg heptachlor epoxide (SC = 0.0006 mg/kg). In addition, several metals exceeded SC: 14.1 J mg/kg cadmium (SC = 1.7 mg/kg), 98.7 J mg/kg chromium (SC = 37.3 mg/kg), 0.51 J mg/kg chrysene (SC = 0.0571 mg/kg), 129 J mg/kg copper (SC = 28 mg/kg), 132 J mg/kg lead (SC = 38.8 mg/kg), 0.85 J mg/kg mercury (SC = 0.249 mg/kg), and 174 J mg/kg zinc (SC = 171 mg/kg). This sample is located within the GPB area and is addressed through the GPB and BSB Focused FS (FFS) (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

No SC exceedances have been detected in the groundwater beneath Site 29 and no surface water samples were collected. Groundwater for this site is addressed in the PICA-076 Area D groundwater ROD (USEPA 2004a).

### 3.2.4 Summary of Risk Assessments

#### 3.2.4.1 Human Health

Site-specific HHRA was not performed for Site 29; however, Site 29 was included within the HHRA for Building 31 and 33 receptors in the Building 31 & 33 Ecological and Human Health Risk Assessment. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of HHRA calculations for carcinogenic risk at building 31 and 33 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and future Industrial/Research Worker: carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1
- Current and future Construction/Excavation Worker: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- Residential Adult (chemical risks): carcinogenic risk number of 4E-04/ noncarcinogenic HI of 3.
- Residential Child (chemical risks): carcinogenic risk number of 2E-04/ noncarcinogenic HI of 10.
- Residential Adult and Child (chemical risks): carcinogenic risk number of 6E-04.

#### *3.2.4.2 Lead Blood Model Results*

The lead blood model was not calculated at this site as lead was not identified as a COPC in soil.

#### *3.2.4.3 Ecological*

Site 29 is situated in an industrialized area, with habitat consisting mostly of paved areas around existing buildings and grasses areas. The area itself is not heavily wooded. Based on the existing habitat quality, wildlife would not be expected to utilize the site to any significant extent. However, some transient species may visit the site and some exposure to surface soil constituents may potentially occur. However, the entire area of Site 29 is currently capped eliminating the risk for surface soil exposure. In addition, the contaminants identified at Buildings 31 and 33 were screened against ecological benchmark concentrations. Results indicated that the contaminants of potential ecological concern (COPECs) identified in surface soil at the Building 31 and 33 areas are not expected to have a significant impact on the environment due to the limited size and the low habitat quality.

#### 3.2.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is at or less than 1;
- Lead is not a concern at this site; and
- Based on limited size and low habitat of the site, significant impacts or ecological risks are not expected at this site.

For the hypothetical residential use risk scenarios evaluated (Adult, Child, and Adult and Child), chemical risks are greater than 1E-04, and the HIs are greater than 1.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.3 PICA-071/Site 45/39 -Vehicle Maintenance (Bldg 33) and Former WW Pretreatment Facility (Bldg 31)**

#### 3.3.1 Site History

PICA-071 /Site 45/39 is located in the industrial portion of Area D. Site 45/39 consists of Building 33, located on Third Avenue between Fourth Court and Farley Street. Building 33 is a two-story structure on a concrete foundation surrounded by asphalt. An inactive rail spur is located 70 ft northwest of the building across Third Avenue. Surface water near Site 45/39 drains to the northwest, towards BSB, via pavement runoff and storm water sewer systems. Site 39 is located across Fourth Court from Building 33, near the northeast corner of Building 31. Site 39 was combined with Site 45/39 in this FS due to their proximity. The location of Site 45/39 is shown in Figure 3-5.

Building 33 was constructed in 1933 as a motor vehicle maintenance shop. The last reported uses of this building include continued use as a motor vehicle maintenance

shop and the southern portion of the building houses a paint and body shop, a vehicle wash, and a waste oil storage area.

Until 1970, waste disposal at Site 45/39 included an in-ground sump located in the middle of the vehicle wash and waste oil storage areas, which collected water from floor and roof drains. The oily wastewater collected in the sump was pumped through a pipe under Fourth Court to a treatment unit in Building 31 (Site 39); however, according to another report (ECI 2005a), this sump and pipeline were not operated and were closed with NJDEP approval. Between 1970 and 1984, waste oil was stored in 55-gallon drums within a concrete berm in the Vehicle Wash/ Waste Oil Storage Area, and was periodically taken to the power house (Building 507) to be used as fuel. In 1984, PTA began disposing of waste oil as hazardous waste at appropriate off-site facilities. Other wastes stored in this area prior to off-site disposal included waste radiator coolant, drained battery acid, and cloths containing oil and paint thinner (Benioff, et.al. 1991). Currently, waste from the repair shop is contained in an aboveground storage tank (AST) where it is stored in accordance with waste oil storage and accumulation regulations.

There are two other ASTs of unknown size located in Building 33. The first is a new oil storage tank and the other is located near the paint and body shop. While these storage tanks are reportedly inactive, they are connected to the building floor drains.

Several spills were reported between 1988 and 1991 at Building 33, including dilute herbicide, hydraulic oil, degreaser, and diesel fuel. Spill amounts ranged from 5 to 33 gallons, and all occurred within Building 33 or on paved outdoor surfaces. While spill locations were not identified on report figures, the 1998 Phase I RI (Dames and Moore 1998) indicated that these spills did not appear to have potential environmental impact.

There are currently no plans for future construction at PICA-071/Site 45/39.

### 3.3.2 Previous Investigations

Previous investigations at and around Building 33 are documented in the 1991 RCRA Closure Verification Investigation (Carpenter Environmental Associates, Inc. [CEA]) 1998 Phase I RI Report (Dames and Moore no samples collected); 1999 Phase I and 2000 Phase II RI (ECI 2002 and update 2005a); UST Removal Action Report for the 10,000 Gallon Gasoline UST (ECI 2001); and Annual Groundwater Monitoring Reports (Shaw 2005b). The sampling locations for historical investigations at Site 45/39 are shown on Figure 3-6. In 1991, closure activities were conducted at Site 45/39 as part of

the RCRA Closure Verification Investigation (Carpenter Environmental Associates, Inc. [CEA] 1991). These closure activities are also summarized in the Phase I RI (Dames and Moore 1998). The closure required all wastes to be removed from the area and all surfaces within the vehicle wash room to be decontaminated. The sump at the center of the room that had been used to collect vehicle wash and rinse water was pressure-washed, and rinsate from this process was analyzed for eight RCRA metals. Additionally, two concrete chip samples were collected from the floor of the storage area and analyzed for priority pollutant metals (PP metals). One composite paint chip sample was collected from paint on the floor and walls of the storage area and analyzed for TCLP lead. CEA concluded that lead in the rinsate, chip, and paint samples was due to the leaded paint used on the walls and floors of the facility. A letter from NJDEP dated December 8, 1992 stated that closure activities at Building 33 were complete according to the closure plan.

#### *3.3.2.1 Abandoned 10,000 Gallon UST*

An abandoned 10,000-gallon gasoline UST filled with sand was discovered by the Picatinny Environmental Affairs Office (EAO) across Third Avenue from the northern corner of Building 33 in June 1994. Three samples of the sand fill were collected in 1994 and analyzed for VOCs, TPH, and metals. Soil sampling was performed around the tanks on three occasions during the same year as part of a 1996 UST tank closure investigation. Additionally, LNAPL was found in well 33-T-3, immediately west of the abandoned UST. A volume of approximately 50 to 90 gallons of gasoline LNAPL was estimated to be in this area. To delineate the groundwater impacts in this area, 11 well points and four permanent wells (33-5, 33-6, 24-6, and 31-9) were installed and sampled by the United States Geological Survey (USGS) in addition to the existing wells in the area (Imbrigotta and Rice 1997).

During the Phase I RI, 11 Geoprobe soil borings B-1 through B-11 were advanced to a maximum of 12 ft to delineate the extent of impacted soil around the tank. Two samples per boring were collected and analyzed for VOC+10, BN+10, target compound list (TCL) pesticides, and TAL metals. Soils were field-screened for LNAPL as the borings were advanced. Temporary well points (TWP) were also placed at four boring locations (GW-1 at B-8, GW-2 at B-1, GW-3 at B-7, and GW-4 at B-4), and groundwater samples collected from these TWPs were analyzed only for VOC+10. Three additional permanent groundwater monitoring wells (33-7, 33-8, 33-9) were installed, and three rounds of groundwater monitoring were conducted between 1999 and 2000 during the Phase I and II RI. No additional soil sampling was performed during the Phase II RI. The UST was excavated in 2001. Approximately 609 tons of soil

were removed from the 12-foot deep excavation and shipped offsite for recycling. Additionally, approximately 6,185 gallons of groundwater were pumped from the excavation and disposed offsite. Twelve post-excavation samples (S-1 through S-12) were collected from the excavation. One additional groundwater monitoring well, 33-10, was installed and another round of groundwater samples was collected for VOC+10 and natural attenuation parameters. Semi-annual groundwater monitoring was conducted from 2003 through 2005 to assess natural attenuation processes.

#### *3.3.2.2 Former Gasoline Tanks*

Two gasoline tanks and a pump island were identified on a 1940 map titled "Installation of Fuel Oil Storage Tank, Gas and Fuel Pumps, Bldg 33" (ECI 2001). In 1999, geophysical and electromagnetic surveys were conducted near Third Avenue and Fourth Court in order to locate the tanks. Results of the survey confirmed that tanks were removed (ECI 2005a).

During the Phase I RI, four Geoprobe soil borings (B-12 through B-15) were advanced near the former tank locations and a fifth (B-16) was advanced near the former pump location. Two soil samples were collected from each borehole (33-SS-24 through -34). Soil samples were analyzed for VOC+10 and lead. Soil samples from boring B-16 also were analyzed for TPHs, BN+10, TAL metals, and PCBs. TWP were also placed at the five boring locations (GW-5 at B-12, GW-6 at B-13, GW-7 at B-14, GW-8 at B-15, and GW-9 at B-16), and groundwater samples collected from these TWPs were analyzed only for VOC+10, with the exception of B-16, which was also analyzed for BN+10.

During the Phase II RI, two additional Geoprobe borings (2B-20 and 21) were advanced to 12 ft. The borings were field-screened to delineate the extent of LNAPL in the subsurface.

#### *3.3.2.3 Sump Pit at south End of Building 33*

A concrete sump located at the southwest corner of Building 33 was investigated in order to assess the potential for petroleum hydrocarbons impacts. During the Phase I RI activities, three Geoprobe soil borings (B-17 through B-19) were advanced around the sump pit. Two subsurface soil samples were collected from each boring (33-SS-35, 36, and 33-SS-46 through -48) and analyzed for TPHs, VOC+10, BN+15, PCBs, and TAL metals.

During the Phase II RI, six additional soil borings (B-17 through B-19 and 2B-10 through 2B-12) were advanced near the sump pit to delineate the extent of BN compounds. Seven subsurface soil samples were collected (33-SS-17 through 23) and analyzed for BN+10.

#### 3.3.2.4 Interior of Building 33

During the Phase I RI, six soil borings (B-20 through B-25) were advanced in the central portion of Building 33 to assess potential impacts associated with a former underground hydraulic vehicle lift and a former dry well. Eight subsurface samples (33-SS-37 to 44) were collected and analyzed for TCL VOC+10, TCL BN+10, TCL PCBs, TAL metals, and TPH.

#### 3.3.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-6 shows the location and concentrations where one or more constituent exceeded an SC.

##### 3.3.3.1 Abandoned 10,000 Gallon UST

The extent of free product observed during the 1999 10,000-gallon gasoline UST investigation was delineated by borings B-2, B-3, B-5, and B-6. Impacted soil around borings B-1, B-2, B-3, B-5, and B-6 was removed during the UST removal in 2001. Boring B-8 is the only remaining boring collected as part of the UST investigation that has soil containing a constituent, arsenic, at a concentration greater than the SC (19 mg/kg). Arsenic was detected in the soil sample collected from the 6.5 to 7-foot bgs interval of B-8 at a concentration of 26 mg/kg. This boring location is adjacent to a rail spur, where it is likely that arsenal herbicides were historically used to control foliage on the tracks.

Groundwater collected from temporary well points installed in 1999 contained concentrations of benzene greater than the SC = 1 ug/L. The well point installed at the B-4 soil boring location contained benzene at a concentration of 80 ug/L, and the well point installed at B-7 contained benzene at a concentration of 5.6 ug/L. Groundwater samples collected from permanent monitoring wells D-33-6, D-33-7, D-33-8, D-33-10, and D-33-T-1 contained benzene, when detected, at concentrations greater than the SC ranging from 1.2 JD ug/L in D-33-7 to a maximum of 4.5 ug/L in D-33-10. Benzene detections in groundwater samples were infrequent and generally less than 5 ug/L. In

all of the sample locations where benzene was detected in June of 2005, it was only detected in location D-33-6 in December of 2005. Benzene was not detected in monitoring wells D-33-T-2 and D-33-T-3, which appear to be the northern and western boundaries, respectively, of the benzene impacts in this area. The results of groundwater monitoring conducted from 1999 through 2005 indicated that benzene in groundwater associated with the former UST was undergoing natural biological degradation and that the plume was not expanding.

TCE was detected in one groundwater monitoring well D-31-5 at a concentration of 3.4 ug/L in 2000 (SC = 1 ug/L). This well is outside of the area of impact attributed to gasoline USTs, indicating that the TCE detected is not related specifically to historical activities at Site 45/39. Naturally occurring metals and anions commonly detected at concentrations greater than the SC in PTA groundwater samples included aluminum, iron, manganese, chloride, and nitrite. Aluminum (SC = 200 ug/L) was detected in monitoring well D-31-8 at a concentration of 1180 ug/L. Manganese (SC = 50 ug/L) was detected during two sampling events in monitoring well D-31-9; with concentrations of 356 ug/L and 144 ug/L. Iron (SC= 300 ug/L) ranged in concentration from not detected to a maximum of 13,900 ug/L in D-33-8. Chloride (SC = 250,000 ug/L) ranged from 37 ug/L to a maximum of 1,550,000 ug/L at sample location D-33-T-2. Nitrite (SC = 1,000 ug/L) was detected during a 2003 sampling event in monitoring well D-33-7 at a concentration greater than the SC (17,200 ug/L).

Groundwater for this site is addressed in the PICA-076 Area D FS.

#### *3.3.3.2 Former Gasoline Tanks*

VOCs were not detected in the four soil borings made near the former gasoline tanks; however, traces of free product were observed at boring B-15 in the 7.5 ft to 8.0 ft depth interval. The temporary well points did not show evidence of free product in the water table, but groundwater samples from three of the temporary well points (placed at boring locations B-12, B-13, and B-15) contained benzene at concentrations ranging from 2.1 ug/L to 8.1 ug/L, which exceeds the SC = 1 ug/L. No free product was observed in the Phase II RI soil borings. Free product was observed in soil samples collected near the former pump island; however, the free product appeared to be related to contamination associated with well 31-6 at the northwest corner of Building 31 rather than the gasoline tanks (ECI 2005a).

The temporary well point placed at soil boring location B-16, between the location of the former USTs and the former pump island, contained benz(a)anthracene (1.0 ug/L)

and benzo(b)fluoranthene (0.8 ug/L) at concentrations greater than the SC of 0.1 ug/L and 0.2 ug/L, respectively.

Groundwater for this site is addressed in the PICA-076 Area D ROD (USEPA 2004a).

### 3.3.3.3 Sump Pit at south End of Building 33

No evidence of free product was observed in soil samples collected from the sump pit area. SVOCs, including benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2,3-c,d)pyrene (SC= 2 mg/kg) were all detected in subsurface soil borings B-17, B-18, and B-19 in approximately the 9 to 11-foot bgs interval at concentrations greater than their respective SC. Concentrations of these compounds ranged from 0.73 mg/kg (dibenz[a,h]anthracene in B-17) to 7.5 mg/kg (benz[a]anthracene in B-17).

### 3.3.3.4 Interior of Building 33

Constituents in soil samples collected from beneath the central portion of Building 33 did not exceed SC.

## 3.3.4 Summary of Risk Assessments

### 3.3.4.1 Human Health

Site-specific HHRA was not performed for Site 45/39. However, Site 45/39 was included within the HHRA for Building 31 and 33 receptors in the Building 31 & 33 Ecological and Human Health Risk Assessment. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within the USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of HHRA calculations for carcinogenic risk at building 31 and 33 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and future Industrial/Research Worker: carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Current and future Construction/Excavation Worker: carcinogenic risk number of  $2E-06$ / noncarcinogenic HI of  $<1$ .

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- Residential Adult (chemical risks): carcinogenic risk number of  $4E-04$ / noncarcinogenic HI of 3.
- Residential Child (chemical risks): carcinogenic risk number of  $2E-04$ / noncarcinogenic HI of 10.
- Residential Adult and Child (chemical risks): carcinogenic risk number of  $6E-04$ .

### 3.3.4.2 Lead Blood Model Results

The lead blood model was not calculated at this site as lead was not identified as a COPC in soil.

### 3.3.4.3 Ecological

Site 45/39 is located in an industrialized area, consisting mostly of paved areas around existing buildings and grasses areas. The area itself is not heavily wooded. Based on the existing habitat quality, wildlife would not be expected to utilize the site to any significant extent. However, some transient species may visit the site and some exposure to surface soil constituents may potentially occur; therefore, contaminants identified at Buildings 31 and 33 were screened against ecological benchmark concentrations. Results indicated that the COPECs identified in surface soil at the Building 31 and 33 areas are not expected to have a significant impact on the environment due to the limited size and the low habitat quality.

### 3.3.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of  $1E-06$  to  $1E-04$ ;

- The noncarcinogenic hazard is at or less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Based on limited size and low habitat of the site, significant impacts or ecological risks are not expected at this site.

For the hypothetical residential use risk scenarios evaluated (Adult, Child, and Adult and Child), chemical risks are greater than 1E-04, and the HIs are greater than 1.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.4 PICA-075/Site 36 - Building 3100, Hazardous and Non-Hazardous Waste Storage Area**

#### **3.4.1 Site History**

PICA-075/Site 36 consists of Building 3100 (135 ft by 40 ft), which was constructed as a storage facility in 1942. The location of Site 36 is shown on Figure 3-7. From 1942 until the early 1950s, the building was used for explosives storage and was serviced by a rail line on the west side of the building. Records indicate that barium peroxide, lead peroxide, and amorphous phosphorous were stored during this time. From the early 1950s until the late 1960s, Building 3100 was utilized as an environmental test building in support of the Naval Air Rocket Test Station (NARTS) program. In 1964, the building was used to test Rita Flare Packs, which resulted in a fire during a test in 1964; however, no environmental damage was reported in association with this fire. In 1966, the building was used for vibration and temperature testing. In 1967, the loading platform was used to mount temperature-conditioning chambers in support of the building's testing program. After the NARTS mission ended, the building continued to be used as an environmental test facility under Army control until the 1970s. The building's explosive allowance was cancelled in 1975 because the building was no longer used. Materials tested include: fully loaded rocket components and ordnance items, such as solid propellant boosters and sustainers, prepackaged liquid rocket engines, and gas generators. No exposed explosives were used at this site.

Use of the building as a waste storage facility began in 1981. The building is currently used as one of the RCRA's permitted hazardous waste storage facilities for Picatinny. The waste is stored in five bays which segregate the wastes by waste type and compatibility. There is also space for office work and general storage.

An inspection of Building 3100 conducted in 1986 indicated that the building contained drums that were leaking at that time. During a 1987 compliance audit conducted by the USEPA, several open drums of waste oil were observed inside the building. In January 1989, a box of hexamethyl phosphorous amide ruptured, spilling approximately 0.05 kilogram (kg) of the material onto the floor of the poison room at the north end of the building. According to a safety office inspection conducted in 1993, an overpack drum containing Agent Orange and butyl esters of 2,4,5-TD and 2,4-D was found partially corroded. According to a 1994 building inspection, drums had frozen and were bulging in bay 5 of the building. However, there have been no documented releases of waste outside the building into the environment, and there were no indications that the integrity of the flooring in the building was not adequate to protect the environment from spills within the building (i.e., no cracks in the flooring to allow spills/leaks to reach the underlying soils).

According to a 1988 PTA transformer inventory database, there were three 100-kilovolt ampere (KVA) (TR-3100) transformers located on a pad on the north side of Building 3100. The condition of these transformers was described as fair. The current status or presence of these transformers is not known.

There is an out-of-service 5,000-gallon steel ethylene glycol AST on the building's south side. The age of the tank is unknown; however, because this ethylene glycol tank was used to support environmental testing at Building 3100, the tank was most likely installed in the early 1970s. The tank is supported a few ft above the ground surface by steel supports and reportedly has no piping connections to the building. The tank has no secondary containment. The empty AST was slated for removal; however, site contacts could not confirm that removal has been conducted.

There are currently no plans for future construction at PICA-075/Site 36.

### 3.4.2 Previous Investigations

During 1981 building renovations to allow use as a permitted hazardous waste storage facility, bags of asbestos and friable asbestos materials were discovered in the

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

building. The building underwent an asbestos abatement in conjunction with the renovation of the building.

In August 1991, stormwater samples were collected during a rain event that caused outdoor berms to overflow. Three grab samples and two composite samples were to be collected from the berms on the loading dock, on the west side of the building where hazardous waste drums were temporarily stored. The storm event ended before composite samples could be collected. The grab sample from the northernmost gap in the berm exceeded the effluent limits for total suspended solids, lead, and pH.

Site documents indicate that air sampling was conducted in the building to assess the potential for worker exposure to airborne contaminants. The samples were analyzed for solvents, chlorinated solvents, and inorganics. Only low levels of solvents were detected, and all levels were less than Occupational Safety and Health Administration (OSHA) standards.

Five surface soil samples were collected as part of the Phase III Preliminary Assessment (PA) / Site Investigation (SI) program conducted in 1996 (ICFKE 1998). Surface soil samples 3100SS-A, 3100SS-B, and 3100SS-C were collected on the west side of Building 3100 immediately adjacent to the paved area beneath the building's loading dock. Surface soil sample 3100SS-D was collected from the southern end of Building 3100 from the soil beneath the ethylene glycol AST. All samples were analyzed for VOCs, SVOCs, pesticides, PCBs, explosives, metals, and anions. Surface soil sample 3100SS-E was collected immediately adjacent to the transformer pad on the north side of Building 3100 to investigate the potential for leaks from the transformer. This sample was not analyzed for metals or anions.

As part of the Phase III 2A/3A RI, monitoring well installation was attempted at three separate locations in the vicinity of the ethylene glycol AST; however, unexploded ordnance (UXO) clearance could not be obtained to a depth sufficient to install a monitoring well at any of these locations. One subsurface soil sample (6MW-5A) was collected from one of the attempted monitoring well locations, from a depth of 4 to 6 ft, and was analyzed for VOCs, SVOCs, TAL metals, cyanide, anions, explosives, and ethylene glycol. Additional sampling at this site was not warranted for the Phase III 2A/3A RI. Groundwater samples were not collected in direct association with Site 36; however, groundwater monitoring wells were installed and sampled within and around the adjacent, downgradient site, PICA-162 (052)/Site 6, and those results are discussed with Site 6.

### 3.4.3 Nature and Extent of Contamination

Data are not available from the Picatinny Database for Site 36; however, data in former reports were reviewed, and the historical sample locations for Site 36 are shown on Figure 3-8.

None of the surface or subsurface soil samples collected at PICA-075/Site 36 had concentrations of any constituents which exceeded their respective SC.

### 3.4.4 Summary of Risk Assessments

The Phase III PA/SI recommended no further action for Site 36; therefore, human health and ecological risk assessments were not conducted due to the low concentrations of potential contaminants. The historical data was compared to the NJDEP Residential Soil Remediation Standard (SRS) and the USEPA RSLs, and there were no exceedances. Therefore, this site qualifies for No Further Action (NFA) and can be released for unrestricted use.

## **3.5 PICA-075/Site 47 - Buildings 3005 and 3006, Heavy Equipment Maintenance**

### 3.5.1 Site History

PICA-075/Site 47 consists of Buildings 3005 and 3006. Building 3005 is a 3,500 ft<sup>2</sup>, one-story structure that was constructed in 1941 for use as a railroad roundhouse and for the storage of construction equipment (Figure 3-9). The roundhouse was used through the 1960s to store locomotives and rail cars that transported coal to the Navy Hill power house (Building 3405). Building 3005 was converted for use as a maintenance facility for repairing heavy equipment (e.g., bulldozers) in 1962 and is still used for this purpose. A pit was associated with Building 3005 and was used by mechanics during the repair and maintenance of locomotives. In 1976, the pit was backfilled, but the source of the backfill material is unknown.

Prior to 1962, the primary substances used at Building 3005 were lubricating oil, coal, locomotive fluids, and fuel oil. After 1962 maintenance-related activities generated wastes, such as oily rags, oil, absorbent contaminated with oils, batteries, steel, and aluminum shavings, in unknown quantities. The absorbent material was used for spill containment and control. Waste materials were reportedly drummed and stored on a concrete pad (Building 3005-A). A May 1989 spill report indicated that 2 gallons of hydraulic fluid leaked onto the asphalt and gravel near Building 3005 as a result of

repair activities on a vehicle with a cracked hydraulic line. According to Picatinny personnel, the incident was reported to NJDEP and cleaned in an appropriate manner.

A 5,000-gallon UST was located in the grassy area east of Building 3005 between the building and Main Road. The UST (UST #44) was constructed of steel and was used to store #2 diesel fuel. The tank was believed to have been installed in 1983 and was removed in September 1990 because it was no longer operational.

Building 3006 was constructed by the Navy in 1953 as a storage building. Building 3006 was used to store waste: waste motor oil, oily rags, and contaminated speedy-dry were temporarily stored inside the building (Solecki 1989). Operation of the building was transferred to the Army in 1962, and building use remained the same; however, the building was also used for a few years in the mid 1980s for the repair of small gas engines. Reported wastes generated at Building 3006 were gasoline, oil, oily rags, and aerosol spray cans. According to Picatinny personnel, used engine oil was previously disposed of by pouring it into a pit located on the south side of Building 3006 and down the steep slope on the west side of the building.

There are currently no plans for future construction at PICA-075/Site 47.

### 3.5.2 Previous Investigations

As part of closure activities for Building 3005, oil drums and any other remaining materials located in the shed on the west side of Building 3005 were removed. Confirmatory samples were collected on October 11, 1991. The shed was steam cleaned and surveyed for UXO clearance and underground utilities. Verification samples were collected, including chip, wipe, and soil samples. The soil samples were collected from a hole bored through the concrete floor. No building-specific studies have been conducted at Building 3006.

The removal of UST #44 and the excavation of the soil around this tank were carried out in 1990 (closure report submitted in 1991). According to the Tank Closure Report, soil samples collected during excavation showed low levels of TPH contamination. The total amount of soil removed from the area of the tank was estimated to be two cubic yards. A second round of sampling was performed after completion of removal activities, samples were analyzed for TPHs and no exceedances were found.

The initial Phase II RI sampling activities (Round 1) at Site 47 were conducted between May 1995 and November 1996. The Phase II Round 1 RI sampling program for Site 47

included a geophysical and soil-gas survey and the collection of 18 surface soil and 16 subsurface soil samples. These samples were analyzed onsite for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPHs. An additional 6 surface soil samples and 21 subsurface soil samples were collected from 2 soil borings, 2 test pits, and during the installation of 2 monitoring wells. Test pits were excavated to investigate anomalies found by the geophysical survey. Two groundwater samples were collected from the monitoring wells.

A geophysical survey was conducted to identify a former waste oil pit between Buildings 3006 and 3005A and to confirm the previous removal of the UST at the southern area of the site. The survey concluded that there was no indication of a UST remaining; however, several unexplainable anomalies were identified. Test pits 47-TP-001 and 47-TP-002 were excavated to investigate two of these anomalies. Three soil samples were collected from each test pit. The test pit samples were analyzed onsite for TCL VOCs, TCL SVOCs, pesticides, explosives, and PCBs. Test pit samples were analyzed offsite for inorganics.

Follow-up investigations (Round 2) were conducted between May and June 2001, which included the collection of three surface soil and three subsurface soil samples.

### 3.5.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-10 shows the location and concentrations where one or more constituent exceeded an SC.

There were no VOC, pesticides, PCBs, or explosive exceedances in surface soil samples. The SVOC benzo(a)pyrene was detected at concentrations which exceeded the SC (0.2 mg/kg) at four surface sample locations: I-47-SS-008A (20 mg/kg), I-47-SS-006A (0.70 mg/kg), I-47-SS-009A (0.45 mg/kg), and I-47-SS-011 (0.32 mg/kg). All other SVOCs detected above their respective SC in surface soil were located at sample I-47-SS-008A and included: benz(a)anthracene (10 mg/kg, SC = 2 mg/kg), benzo(b)fluoranthene (20 mg/kg, SC = 2 mg/kg), dibenz(a,h)anthracene (2 mg/kg, SC = 0.2mg/kg), and indeno(1,2,3-c,d)pyrene (10 mg/kg, SC = 2 mg/kg). Two surface soil samples contained metals at concentrations greater than their respective SC: manganese at I-47-MW-001 (6,100 mg/kg, SC = 5,900 mg/kg) and arsenic at I-47-SS-008A (23.9 mg/kg, SC = 19 mg/kg).

In subsurface soils, there were no SC exceedances for VOCs, pesticides, PCBs, or explosives. There were detections of SVOCs in subsurface soils, but only a few SC exceedances including: benzo(a)pyrene (SC = 0.2 mg/kg) at I-47-SS-011 (1.2 mg/kg) and I-47-SB-001 (0.80 mg/kg), and dibenzo(a,h)anthracene (SC = 0.2 mg/kg) at I-47-SS-011 (0.21 J mg/kg). One subsurface sample location contained one metal at a concentration greater than its SC: manganese (SC = 5,900 mg/kg) at I-47-MW-002 with a concentration of 6,800 mg/kg.

For groundwater, SC were not exceeded for SVOCs, pesticides, PCBs, or explosives. The only VOC identified at concentrations greater than the SC (3 ug/L) was methylene chloride in well I-47-MW-001 at a concentration of 4.4 ug/L. Methylene chloride is a common laboratory contaminant and it is unlikely that this exceedance is attributable to current or former site activities. The only other constituents detected above SC were metals, most of which are known to be prevalent in native materials in this area of New Jersey. Lead (SC = 5 ug/L) was detected in wells I-47-MW-001 and I-47-MW-002 in concentrations of 6.19 ug/L and 16.80 ug/L, respectively. Lead was also detected in several groundwater samples from surrounding sites, at concentrations slightly greater than the SC. A groundwater sample from well I-47-MW-001 exceeded the sodium SC (50,000 ug/L) at a concentration of 61,900 ug/L. A groundwater sample from well I-47-MW-002 exceeded the SC for aluminum (SC = 200 ug/L), iron (SC = 300 ug/L), and manganese (SC = 50 ug/L) with respective concentrations of 249 ug/L, 36,400 ug/L, and 861 ug/L.

Subsurface soil at I-47-MW-002 exceeded SC concentrations for manganese, which may be related to the groundwater exceedance of manganese observed in groundwater from this well. No surface soil exceedances for manganese were observed, however. It is, therefore, likely that the manganese is due to native materials rather than specific site activities.

### 3.5.4 Summary of Risk Assessments

#### 3.5.4.1 Human Health

An HHRA for Site 47 receptors were previously provided in the Phase II RI Report (Shaw 2005c). The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of HHRA calculations for carcinogenic risk at Site 47 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and future Industrial/Research Worker: carcinogenic risk number of 4E-05/ noncarcinogenic HI of <1.
- Current and future Construction/Excavation Worker: carcinogenic risk number of 6E-07/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.5.4.2 Lead Blood Model Results*

The lead blood model was not calculated at this site as lead was not identified as a COPC.

#### *3.5.4.3 Ecological*

Site 47 consists of buildings, pavement, and mowed grassy areas. The soil samples were collected in the mowed area beneath the pavement or on a hillside constructed of rubble. As a result, the site was not evaluated in the Phase II ERA because ecological risks were considered to be minimal.

#### *3.5.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is at or less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Based on habitat and site use, significant impacts or ecological risks are not expected at this site.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated

and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.6 PICA-075 /Site 102 – Building 3050, Former Enlisted Men’s Barracks**

#### **3.6.1 Site History**

Building 3050 is a U-shaped (~3,100 square ft) structure with symmetrical wings and was built in 1934. Building 3050 has only been used as a barracks (Figure 3-11). The building has a dark room available for personnel to develop photographs. The dark room is located on the basement level in the southwest corner of the building.

Transformer TR-3050 (old number 3056), located on Main Road west of Building 3050, was replaced with a new transformer in the late 1990s as part of a facility-wide transformer replacement/removal action.

Waste materials generated at Building 3050 come from photographic development activities performed in the dark room. These wastes include photographic developers, stop bath, and fixing/clearing solutions. Documentation states that the fixing/clearing solution is flushed down a sink drain, while the other materials are stored in hazardous waste containers and sent to the Picatinny Burning Ground.

According to Picatinny personnel, an oil and lube rack was once located on the west or north side of Building 3050 and was used to change automobile fluids (including oil). The rack was removed and the area was backfilled between 1983 and 1984. A spill report indicated that approximately 2,000 gallons of sewage overflowed onto the soil at Building 3050. The exact location of the spill was not documented. The spill was remediated by chlorinating the area. According to Picatinny personnel, this was an isolated incident.

There are currently no plans for future construction at PICA-075/Site 102.

#### **3.6.2 Previous Investigations**

A geophysical survey, using an EM61, was conducted over an approximate 250 ft by 50 ft grid with 50 ft grid spacing in the parking area behind the barracks in 1995/1996. The objective of the survey was to verify the location and orientation of a 1,000-gallon fuel oil UST. One unexplained anomaly was discovered near the northwestern corner of Building 3050. In an effort to gain more information on this anomaly, three ground

penetrating radar (GPR) lines were run in the vicinity of the EM61 anomaly. No evidence was acquired from the two geophysical methods of an UST at this site. However, in order to investigate the EM61 anomaly, monitoring well 102MW-2 was located downgradient of the anomaly. One test pit, 102TP-1 was installed near the anomaly identified in the parking area. An UST with approximately 500 gallon capacity was uncovered in the test pit about 1 ft below the asphalt pavement. Upon discovery of the UST, the Picatinny Safety Office was notified and the excavation was backfilled. The tank was subsequently removed.

Geophysical surveys were also conducted over an approximate 250 ft by 50 ft grid in the area immediately to the north of Site 102 parking lot. The EM31 method was used in the conductivity and in-phase modes to screen the area for USTs. The two data sets showed the presence of some metallic debris but no USTs.

A 1,000-gallon #2 fuel oil UST was located on the north side of Building 3050. The tank was believed to be 25 years old and out of service when it was removed by Weston in October 1993. Additionally, the area of the former UST was investigated as part of the Phase II RI. A 500-gallon UST was also removed from the parking area.

The initial Phase II RI sampling activities (Round 1) at Site 102 were conducted between May 1995 and November 1996. The Phase II Round RI sampling program for Site 102 included conducting a geophysical and soil-gas survey, sampling newly installed wells, and collecting eighteen surface soil and twenty subsurface soil samples.

Follow-up investigations (Round 2) were conducted between May 2001 and June 2002 based on the results of the previous sampling and included collection of 12 surface soil, three subsurface soil, and 11 groundwater samples (from wells and hydro-punch). Samples were generally analyzed for VOCs, SVOCs, pesticides, metals, and TPH.

A soil-gas survey was conducted at Site 102 in 1995 within an approximate 140 ft by 100 ft grid. The grid was located on the northeast side of Building 3050 in the area of the former 1,000-gallon UST and the reported unauthorized motor oil disposal area. The survey was conducted on a 20-ft grid spacing. A total of 37 soil-gas samples were collected from the survey grid. Acetone (0.45 parts per million volume [ppmv]) was detected in a soil-gas sample collected on the southeast corner of the survey grid, and total xylenes (0.58 ppmv) were detected in a sample collected along the edge of the tree line and the asphalt parking lot. 1,1-dichloroethene (DCE) and cis-1,2-DCE were detected at concentrations of 1.08 ppmv and 0.18 ppmv, respectively, in a sample

collected at the bottom of the hill in the woods on the north side of the stream line. None of the constituents detected in the soil gas survey were detected in soil samples in concentrations that exceeded their respective SC, as discussed in the following Nature and Extent of Contamination section.

### 3.6.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-12 shows the location and concentrations where one or more constituent exceeded an SC.

Surface soil samples were collected, and analyzed both onsite and offsite. Some of the constituents selected for off-site analysis were selected based upon onsite detections. Several SVOCs were detected in surface soil samples at concentrations that exceeded the respective SC including: Benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), benzo(k) fluoranthene (SC = 23 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2,3-c,d)pyrene (SC = 2 mg/kg). Benzo(a)anthracene was detected with concentrations greater than the SC in six samples and ranged from 2.10 mg/kg to 30 mg/kg. Surface soil concentrations that exceeded SC for benzo(a)pyrene were observed in eight samples and ranged from 1.3 mg/kg to 40.0 mg/kg. Six samples contained concentrations of benzo(b)fluoranthene in excess of the SC, ranging from 2.10 mg/kg to 40.0 mg/kg. Benzo(k)fluoranthene concentrations exceeded the SC at one sample location with a concentration of 40.0 mg/kg. Dibenz(a,h)anthracene exceeded the SC at five sample locations with concentrations ranging from 0.24 mg/kg to 5 mg/kg. Indeno(1,2,3-c,d)pyrene exceeded the SC in four samples with concentrations ranging from 6.1 mg/kg to 30.0 mg/kg.

There was only one location in surface soils at which a pesticide (4,4-dichlorodiphenyltrichloroethane [DDT]) exceeded the SC, which is 8 mg/kg: 102SS-3A (18 mg/kg). The only other constituents detected in surface soils at concentrations greater than the SC were three metals: lead (SC = 800 mg/kg), arsenic (SC = 19 mg/kg), and manganese (SC = 5900 mg/kg). Arsenic exceedances were as follows: 102MW-1A (25.9 mg/kg) and 102TP-1A (23 mg/kg). Lead exceedances were as follows: 102SS-7A (2,630 mg/kg), 102SS-18 (1,570 mg/kg), 102SS-2A (1,790 mg/kg), 102SS-3A (2,800 mg/kg), and 102SS-4C (875 mg/kg). The majority of lead SC exceedances occur at sample locations that are directly north of Building 3050. There was only one manganese exceedance at 102MW-2A (6,130 mg/kg).

There were no subsurface samples that exceeded SC for any constituents analyzed at the laboratory.

In groundwater, one VOC was detected at a concentration greater than the SC (3 ug/L): methylene chloride (a common laboratory contaminant) was detected at a concentration of 5.3 ug/L, but reports indicate this exceedance was in the sample blank as well. Other constituents which exceeded SC were generally naturally occurring inorganics: aluminum (SC = 200 ug/L), chloride (SC = 250,000 ug/L), iron (SC = 300 ug/L), manganese (SC = 50 ug/L), sodium (SC = 50,000 ug/L), and thallium (SC = 0.5 ug/L). Lead concentrations exceeded SC (5 ug/L) in six groundwater samples with a range from 9.8 ug/L to 190 ug/L. Lead was also detected in several groundwater samples from surrounding sites, at concentrations slightly greater than the SC. The remaining constituents exceeded SC at two locations: I-102- HP-003 and I-102-MW-001. The aluminum concentrations were 30,700 ug/L and 25,500 ug/L, respectively. The iron concentrations were 31,000 ug/L and 46,900 ug/L, respectively. The manganese concentrations were 2,400 ug/L and 536 ug/L, respectively. Arsenic (7.10 ug/L) and thallium (1.70 ug/L) only exceeded SC in I-102- HP-003, while chloride (310,000 ug/L) and sodium (159,000 ug/L) only exceeded SC in I-102-MW-001. Most of the groundwater exceedances observed were due to naturally occurring metals.

### 3.6.4 Summary of Risk Assessments

#### 3.6.4.1 Human Health

An HHRA was completed for Site 102 receptors and provided previously in the 2005 Phase II RI Report. The carcinogenic risk for the reasonably anticipated future use of the industrial/research worker and construction worker was reassessed in 2009 and updated to include currently acceptable parameters detailed in Appendix C. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk of 1E-06 to 1E-04 for the industrial/research worker and the construction worker. Site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 102 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and Future Industrial/Research Worker: carcinogenic risk number of 1E-04/ noncarcinogenic HI of <1.

- Current and Future Construction Worker: carcinogenic risk number of 7E-07/ noncarcinogenic hazard of 1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.6.4.2 *Lead Blood Model Results*

The current and reasonably anticipated future use scenarios at this site were reevaluated to reflect current guidance for model input parameters, as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial Worker (surface soil): No concern – the average lead concentration of 849 mg/kg is less than the calculated PRG of 1,092 mg/kg.

#### 3.6.4.3 *Ecological*

Although Site 102 consists predominantly of Building 3050 and pavement, the site was evaluated in the Phase II ERA because the site is adjacent to forested areas. Of the ten earthworm tissue samples analyzed from the Phase II sites, including control and reference samples, the Site 102 earthworm tissue contained the maximum concentrations of the polynuclear (or polycyclic) aromatic hydrocarbon (PAH) fluoranthene and pesticides 4,4'-DDD; 4,4',4'-DDT; and 4,4'-DDE. All of these compounds were detected in the surface soil samples collected at Site 102. Despite the elevated concentrations of these compounds in the earthworm tissue, it does not appear to have affected the survival of the earthworms. Environmental effects quotients (EEQ) for the COPECs detected in earthworm tissue samples collected from the Site 102 soil bioassay were less than 1 for all chemicals with the exception of 4,4'-DDT (1.34) in the woodcock. The food chain modeling suggests that there is little potential risk to terrestrial mammals and avian species from soil exposure at Site 102.

#### 3.6.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is at or less than 1;
- Lead is not a concern at this site; and
- Ecological risks are expected to be minimal to terrestrial mammals and avian species.

No hypothetical use scenarios were evaluated for this site.

### **3.7 PICA-075/Site 188 - Building 3173, Former Coal Storage Area**

#### 3.7.1 Site History

PICA-075/Site 188 consists of Building 3173. The layout of Site 188 is shown on Figure 3-13. Building 3173 was used as a carpentry shop and storage area from the time of its construction in 1902 until the late 1950s. The building has a coal storage area behind it that was used for the Building 3013 power plant from approximately the 1930s until the 1960s. This former coal storage area is referred to as Building 3175. In the early 1960s, Building 3173 was converted for use as an Explosive Ordinance Disposal (EOD) laboratory. This laboratory is thought to have been primarily an ordnance and physical testing facility, not a chemical laboratory. In 1968, the building was assigned to the Aerial Mine Division as a laboratory. In 1989 the building was used as a youth center with a playground proposed for cleared land adjacent to the former coal storage area. In 1992, the proposal to construct a playground in the area behind Building 3173 was cancelled and the youth center was moved to another location. Building 3173 was last reported as being used as office space for a volunteer organization. The building has been used for this purpose since early 1996. During the 1996 ICFKE site inspection, the unpaved area immediately adjacent to the former coal storage area was being used for the staging of concrete rubble.

According to the Picatinny transformer database, at one time there were three 37.5 KVA transformers inside the building. In 1981, these transformers were considered PCB transformers. These transformers contained 25 gallons of dielectric fluid and were reportedly in fair condition. According to a letter from EAO in 1989, the three transformers at the building were leaking. These transformers have since been removed.

Materials used at Building 3173 included coal, small ordnance items, and potentially small amounts of solvents such as acetone, paints, and thinners.

During the tenure of the building as an EOD laboratory, ordnance components were tested and developed in the building. The building only possessed an explosives allowance for small amounts of explosives (less than 1 pound [lb.]). Only a few completed ordnance items were permitted in the building. The majority of these items are believed to have been unloaded. According to a 1961 standard operating procedure (SOP), the area behind the Building 3173 coal bunker was used for the evaluation of a render-safe procedure for ordnance items.

In 1992, approximately 20,000 to 30,000 gallons of sewage is estimated to have spilled from a manhole overflow in the vicinity of Building 3173. The area was chlorinated, and the blockage which caused the overflow was removed.

There are currently no plans for future construction at PICA-075/Site 188.

### 3.7.2 Previous Investigations

In 1991, two investigations were conducted by the USAEHA in order to evaluate the former coal storage area as a potential playground. Initially, six surface soil samples were collected in the former coal storage area and analyzed for TPH, BNAs, and oil/grease. Oil/grease detections ranged in concentration from 114 to 5,440 parts per million (ppm). Detections of TPH ranged in concentration from non-detect to 1,640 ppm. Benzidine and fluoranthene were detected in one sample at concentrations of 0.76 ppm and 0.86 ppm, respectively. Thirteen additional samples were then collected to provide a preliminary evaluation of the constituents detected in the soil samples from the proposed playground site. Nine of the samples were collected in the former coal storage area. One sample was collected downgradient of the coal storage area, one sample was collected adjacent to Building 3173, one duplicate sample was collected, and one background sample was collected. Detections of TPH in surface soil samples in the second round of sampling ranged in concentration from 42 to 660 ppm. The detected concentration of TPH in the background sample was 89 ppm. Detections of Target BNAs were detected in only one sample at concentrations above the method detection limit (MDL). Benzidine was not detected above the MDL.

In 1996, as part of the PA/SI, four surface soil samples were collected from the area of Building 3173 to investigate the constituents present in the area of the former coal storage area and the area downgradient of the former coal storage area. The samples,

L-188-3173SS-A, L-188-3173SS-B, L-188-3173SS-C, and L-188-3173SS-D, were analyzed for SVOCs, anions, and metals.

In 1998, the bulk coal storage areas at Picatinny were identified by U.S. Army Center for Health Promotion and Preventative Medicine (USACHPPM) as potential radioactive sites. USACHPPM noted that naturally occurring isotopes are usually associated with coal. The presence of the radioactive materials is coincidental and usually too small to be of concern. However, this potential source of radioactive material can become important when the volume of coal and its storage time are large. USACHPPM recommended that environmental sampling at the bulk coal storage areas include radiological parameters.

The 2000-2002 Phase III 2A/3A RI at Site 188 included the following:

- Installation of one monitoring well L-188-MW-001;
- One groundwater sample, collected from L-188-MW-001. The sample was analyzed for VOCs, SVOCs, radiological parameters, metals, and the isotope Radium-228;
- Collection of 18 surface soil samples. Analysis of the surface soil samples included VOCs, SVOCs, radiological parameters, metals, and the isotope Radium-228;
- Two subsurface soil samples. Analysis of the subsurface soil samples included SVOCs and metals; and
- Two surface water/sediment samples. Analysis of the surface water and sediment samples included VOCs, SVOCs, radiological parameters, metals, and the isotope Radium-228.

### 3.7.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-14 shows the location and concentrations where one or more constituent exceeded an SC.

No VOCs or radiological parameters were detected in surface soils at PICA-075/Site 188 at concentrations greater than the SC. Thirteen surface soil samples had detections of one or more of the following SVOCs at concentrations greater than their

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

respective SC; benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-c,d)pyrene. The maximum concentrations of all five SVOCs were detected at sample location L-188-MW-001, from 0 to 2 ft. Maximum concentrations of SVOCs were; 17.00 D mg/kg benz(a)anthracene (SC = 2 mg/kg), 15.00 D mg/kg benzo(a)pyrene (SC = 0.22 mg/kg), 17.00 D mg/kg benzo(b)fluoranthene (SC = 2 mg/kg), 2.00 JD mg/kg dibenz(a,h)anthracene (SC = 0.22 mg/kg), and 7.70 D mg/kg indeno(1,2,3-c,d)pyrene (SC = 2 mg/kg). One surface soil sample, location L-188-SS-013 from 0 to 1 ft., had a detection of lead (1020.00 J mg/kg) greater than its respective SC (800 mg/kg). Eleven surface soil samples had detections of arsenic greater than its respective SC (20 mg/kg). The maximum detection of arsenic occurred at location L-188-SS-004 from 0 to 1 ft., at a concentration of 98.40 mg/kg.

There were no detections of constituents greater than their respective SC in subsurface soil samples collected at PICA-075/Site 188.

Sediment samples at locations L-188-SD-001 and L-188-SD-002 had detections of nine SVOCs which exceeded their respective SC: benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, fluoranthene, indeno(1,2,3-c,d)pyrene, phenanthrene, and pyrene. L-188-SD-002 also had a detection of the SVOC benzo(g,h,i)perylene (0.39 J mg/kg) above its SC (0.29 mg/kg). The maximum concentrations of the other nine SVOCs were at L-188-SD-002; 0.64 J mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 0.74 mg/kg benzo(a)pyrene (SC = 0.0319 mg/kg), 0.98 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 0.38 J mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 0.82 mg/kg chrysene (SC = 0.0571 mg/kg), 1.80 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.37 J mg/kg indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg), 0.96 mg/kg phenanthrene (SC = 0.0419 mg/kg), and 1.40 mg/kg pyrene (SC = 0.053 mg/kg). Six metals were detected at concentrations which exceeded their respective SC at location L-188-SD-002. The metals detected at this sediment sample location included; 3.90 J mg/kg cadmium (SC = 1.7 mg/kg), 60.90 J mg/kg copper (SC = 28 mg/kg), 134 J mg/kg lead (SC = 38.8 mg/kg), 13100 JD mg/kg manganese (SC = 1673 mg/kg), 0.31 J mg/kg mercury (SC = 0.249 mg/kg), and 2480 JD mg/kg zinc (SC = 171 mg/kg).

No VOCs, SVOCs, or radiological parameters were detected at concentrations which exceeded SC. Four metals (aluminum, iron, lead, and manganese) were detected at two surface water sample locations, L-188-SW-001 and L-188-SW-002, at concentrations exceeding their respective SC. Maximum concentrations of 1,900 ug/L aluminum (SC = 190 ug/L), 7,200 ug/L iron (SC = 1,790 ug/L), 24.0 ug/L lead (SC = 3.2

ug/L), and 2,400 ug/L manganese (SC = 383 ug/L), were detected in samples collected at L-188-SW-001. Cadmium (1.00 ug/L) and copper (11 ug/L) were also detected at L-188-SW-001 above their respective SC, 0.28 ug/L and 9.4 ug/L. Sodium (42,600 ug/L) and zinc (210 ug/L) were detected at L-188-SW-002 above their respective SC, 42,300 ug/L and 122 ug/L.

No VOCs or SVOCs were detected above their SC in groundwater samples collected at Site 188. One radiological parameter, gross alpha (SC = 15 pCi/L), was detected at a concentration of 16.40 pCi/L in a duplicate sample from L-188-MW-001 on 3 January 2001. Five metals were detected at concentrations above their SC in the groundwater sample collected at L-188-MW-001 on 3 January 2001. Concentrations of these metals were 22,000 ug/L aluminum (SC = 200 ug/L), 5.10 ug/L arsenic (SC = 3 ug/L), 47,200 ug/L iron (SC = 300 ug/L), 8,400 ug/L manganese (SC = 50 ug/L), and 1.70 ug/L thallium (SC = 0.5 ug/L). Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.7.4 Summary of Risk Assessments

#### 3.7.4.1 Human Health

An HHRA was completed for Site 188 receptors and provided previously in the Phase III 2A/3A Site Report (Shaw 2005d). The carcinogenic risk for the reasonably anticipated future use of the industrial/research worker was reassessed in 2009 and updated to include currently accepted parameters detailed in Appendix C. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 188 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industry/Research Worker: carcinogenic risk number of 6E-05/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 4E-09/  
noncarcinogenic HI of <1.

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- Future On-site Youth Visitor: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.
- Future Adult Resident (mixed soil): carcinogenic risk number of 6E-04/ noncarcinogenic HI of 1.
- Future Adult Resident (sediment): carcinogenic risk number of 3E-05/ noncarcinogenic HI of 1.
- Future Child Resident (mixed soil): carcinogenic risk number of 5E-04/ noncarcinogenic HI of 7.
- Future Child Resident (sediment): carcinogenic risk number of 2E-05/ noncarcinogenic HI of 9.
- Future Adult + Child Resident (mixed soil): carcinogenic risk number of 1E-03/noncarcinogenic HI not evaluated.

#### *3.7.4.2 Lead Blood Model Results*

The current and reasonably anticipated future use scenarios at this site were reevaluated to reflect current guidance for model input parameters, as detailed in Appendix C, and the PRG revised accordingly. The following results were reported.

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial Worker (surface soil): No concern – the average lead concentration of 349 mg/kg is less than the calculated PRG of 1,092 mg/kg.
- In addition, human health risks associated with lead exposures for hypothetical use scenarios not reasonably anticipated were determined to be a concern for the Adult Resident and Child Resident scenarios.

### 3.7.4.3 Ecological

There is suitable habitat in the vicinity of the former coal storage area such that wildlife could be exposed to PAH or arsenic in soils or PAHs and metals in the intermittent stream. The Phase III /Phase 1 2A/3A ERA (Shaw 2004b) evaluated a small mammal survey, wildlife exposure modeling, rodent sperm analyses, and a breeding bird survey in Northern Area L to evaluate the potential risk to receptors from the former coal storage area. The ERA determined that it was unlikely that ecological communities in this area are at any further significant risk from site contaminants present in environmental media at these sites, and that further remedial actions based on ecological risks are not warranted.

### 3.7.4.4 Summary or Risks and Hazards

Based on the risk assessments performed for this site for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is <1;
- Lead is not a concern at this site;
- Based on sampling results, radiological parameters are not a concern at this site; and
- There are no likely risks to ecological communities from environmental media at this site.

For the hypothetical residential use risk scenarios evaluated (Adult, Child, and Adult and Child), chemical risks are greater than 1E-04, the HIs are greater than 1, and lead is a concern.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.8 PICA-091/Site 55 - Buildings in 200 Area**

#### 3.8.1 Site History

PICA-091/Site 55 is located immediately southwest of PICA-091 (127) Site 127. The layout of this site is shown on Figure 3-15. This site consists of Buildings 221 and 225. Building 223 was also located within site 55, however, the building has been removed, and the exact location is unknown.

Building 221 was constructed in the mid- to late-1940s. The only known renovation activities occurred in the late 1960s and 1988 as part of an initiative to change PTA from a production facility to a research and development facility. Pilot-scale explosive unit machining and pack-out operations occurred at Building 221 until the early- to mid-1970s. Other activities conducted at Building 221 include explosive unit testing, inspection, and storage (antiquated equipment and operations-related materials such as uranium-235 and methylene chloride). Both explosives and munitions were inspected at Building 221, and the radiographic equipment used is known to have contained a cobalt-60 source, which is a high-energy gamma emitter.

Picatinny Arsenal personnel reported that materials used at Building 221 were limited to explosives, radioactive materials (Cobalt-60 and DU), and small amounts of solvents (primarily acetone) and propellants. Picatinny Arsenal personnel estimated that Building 221 generated less than 25 lbs/yr of propellant and/or explosive wastes and less than 750 gallons/yr of explosives contaminated wastewater operating under full capacity and optimum conditions. All waste material, except contaminated wastewater, was sent to the PTA Burning Ground for disposal. During operational periods, contaminated wastewater from Building 221 (e.g., wastewater from steam traps, wastewater from wash down activities, and wastewater from vacuum pumps and condensate lines) from Building 221 was filtered and discharged to a holding tank at Building 225 via an in-line trough conveyance system. According to PTA personnel, the filtrate was collected as a scrap waste and sent to the PTA Burning Ground for disposal. This trough originates at a 100-gallon collection tank located in a shed on the northeast side of Building 221. Non-contact wastewater was discharged directly onto the ground. Building 221 is reportedly used for materials storage.

Former Building 223 is believed to have been located between Buildings 221 and 225. Because of the building's proximity to Buildings 221 and 225, it is believed that operations would have been similar. Furthermore, when Building 223 was operational,

it is believed that wastewater discharges would have been conveyed via a wooden trough system to Building 225.

Building 225 was constructed in the 1940s and contains eight work bays. The building is reportedly used for machining and light assembly of prototype explosives and propellant units. Specific operations include solid explosives or propellant cutting, drilling, and pressing (casting). Wastewater generated from explosives and propellant operations at Building 225 is collected by floor troughs and conveyed through plastic pipes to a 4,000-gallon collection tank. The collection tank also received explosives contaminated wastewater from Buildings 221, 230, 231, 232, and former Building 223 via a wooden trough conveyance system. The tank was installed in 1955 and is located in the basement of Building 225 in a reinforced concrete room, which provides some secondary containment. The tank was upgraded in 1992 to include a high-level alarm. Wastewater conveyed to the Building 225 collection tank ran through a variety of filters and conveyance systems, and was eventually discharged to BSB. Wastewater may have been managed in this manner until 1983. Wastewater collected in the Building 225 tank is currently stored for up to 90 days and then shipped to Building 809 for treatment.

Picatinny Arsenal personnel reported incidents of tank overflow or leaks, although no records were available. One incident described involved the discharge of approximately 25 gallons of propellant-contaminated wastewater. Reportedly, most wastewater was contained within the trough conveyance system. Similarly, unrecorded overflows of the original trough system were recalled, which prompted intrusive investigations and eventual replacement of the system with flexible piping.

Waste materials generated at Building 225 were limited to waste explosives and propellants (15-50 pounds per month), contaminated wastewater (1,250 gallons per month), and small quantities of solvents (primarily acetone). Waste materials other than wastewater were sent to the PTA Burning Ground for disposal.

Three 75-KVA pad-mounted transformers (TR-225) were located on the east side of Building 225. According to the PTA transformer database, one of the transformers had an Aroclor 1260 concentration of 85 mg/kg, while the other two transformers were not PCB-contaminated. The database also indicated that all three transformers were in fair condition. These transformers were removed in the 1990s as part of a facility-wide transformer removal action.

There are currently no plans for future construction at PICA-091/Site 55.

### 3.8.2 Previous Investigations

#### Site 55, Building 221

In 1990, a health survey indicated that maximum beta levels inside Building 221 were less than detection limits. Other results obtained as part of the survey indicate the highest reading to be 3 milliroentgens per hour at the open port, and 1 milliroentgen per hour around the port after shielding was placed in the opening. The survey was conducted in preparation for and in conjunction with the removal of a radiographic cobalt-60 source used in Building 221. No corrective actions were required as a result of the survey.

#### Site 55, Building 223

No building-specific studies have been conducted at former Building 223.

#### Site 55, Building 225

A 1987 internal investigation resulted in the collection of 18 soil samples from 9 locations near Building 225. These samples were collected from the ground surface and approximately 1 ft bgs. The collected samples were analyzed for HMX, RDX, and trinitrotoluene (TNT). According to PTA, no corrective actions were taken in response to this study because of proposed CERCLA investigation of this site.

RCRA closure activities performed in 1991 for the tank and basement area of this building included the collection of six soil samples. According to correspondence dated December 1992, regarding the closure, the subject area required further action under the 1991 Federal Facility Agreement between the U.S. Army Armament Research Development and Engineering Center (ARDEC) and the USEPA under CERCLA Section 120 (ICFKE 1994). The metals contamination identified during the RCRA closure activities was removed in 1992 during construction of a concrete spill containment pad for the truck loading area in front of Building 225. Soil was excavated to a minimum of three ft and disposed of offsite.

The Phase II RI (Round 1) included a radiological survey and the collection of 32 surface soil, 29 subsurface soil, and four groundwater samples. In addition, one soil boring and three monitoring wells were installed. On-site analysis was performed on all surface soil and subsurface soil samples collected at Site 55. These samples were

analyzed onsite for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

Follow-up investigations (Round 2) were conducted between November 2000 and June 2001, and included the collection of four surface soil, three subsurface soil, and five groundwater samples.

### 3.8.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-16 shows the location and concentrations where one or more constituent exceeded an SC.

There were no SC exceedances for VOCs, explosives, pesticides, or TPH in surface soil samples at Site 55. Three SVOC compounds exceeded SC values: benzo(a)pyrene (SC = 0.2 mg/kg) at H-55-MW-002 (0.43 mg/kg) and H-55-SS-004A (2.5 mg/kg); benzo(a)anthracene (SC = 2 mg/kg) at H-55-SS-004A (2.10 mg/kg); and benzo(b)fluoranthene (SC = 2 mg/kg) also at H-55-SS-004A (3.40 mg/kg). Two PCBs were detected at concentrations greater than the SC: Aroclor 1260 and Aroclor 1254 (both SC = 1 mg/kg). Aroclor 1260 exceeded the SC at H-55-MW-002 (5.9 J mg/kg). Aroclor 1254 exceeded the SC at the following locations: H-55-SS-016 (19 D mg/kg), H-55-SS-002A (1.2 mg/kg), H-55-SS-007C (3.5 mg/kg), H-55-SS-009C (1.8 mg/kg), H-55-SS-010A (1.5 mg/kg), H-55-SS-012A (5.1 mg/kg), and H-55-SS-014 (9.4 D mg/kg). Two metals detected at concentrations greater than their SC were arsenic (SC = 19 mg/kg) at three locations: H-55-SS-002A (40 mg/kg), H-55-SS-003A (40 mg/kg), and H-55-SS-004A (20 mg/kg); and chromium (SC = 200 mg/kg) at one location: H-55-SS-008A (220 mg/kg).

There were no constituents detected at concentrations greater than the SC in subsurface soils.

The SC exceedances in groundwater were limited to explosives and metals. The 1996 data for sample H-55-MW-002 exceeded the SC for 2,4,6-TNT and RDX (both with SC = 2 ug/L) with respective concentrations of 8.51 ug/L and 27.60 ug/L. The 1996 H-55-MW-001 sample also exceeded the RDX SC with a concentration of 2.16 ug/L. Both of the aforementioned were sampled in 2000, and neither sample contained any explosives in concentrations greater than the SC. The only metal detected at concentrations greater than the SC was lead (SC = 5 ug/L) in well H-55-MW003 with

1996 and 2000 concentrations of 9.44 ug/L and 9.65 ug/L, respectively. Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.8.4 Summary of Risk Assessments

#### 3.8.4.1 Human Health

An HHRA was completed for Site 55 receptors and previously provided in the 2005 Phase II RI Report (Shaw 2005c). The carcinogenic risk for the reasonably anticipated future use of the industrial/research worker and construction worker was reassessed in 2009 and updated to include currently accepted parameters detailed in Appendix C. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04 for the industrial/research worker. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 55 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial/Research Worker: carcinogenic risk number of 1E-04/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 6E-07/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.8.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.8.4.3 Ecological

There is limited habitat at Site 55. Most samples were collected in mowed areas or close to the buildings in an area with large boulders. As a result, food chain effects are unlikely and no ERA was conducted for this site.

#### 3.8.4.4 Summary of Risks

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are not a concern due to limited habitat.

No hypothetical land use scenarios were evaluated for this site.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.9 PICA-091/Site 62 – Building 210, Former Hazardous Waste Storage Facility/Fuse Assembly**

#### 3.9.1 Site History

Building 210 was constructed in the 1940s. The site layout is shown in Figure 3-17. The building was originally used as a fuse assembly line where black powder was packed and formed into O-rings. Munitions pack-out occurred here for several years in the early 1970s. Since then, all equipment, except for the fuse presses, have been removed. The building has been decontaminated and was used for hazardous waste storage between September 1986 and 1988. As a hazardous waste storage facility, Building 210 stored small quantities of various chemicals, waste oil, and asbestos. The building was also used to store investigation-derived waste generated from sampling activities.

According to historical documentation, up to 80 pints per day of acetone were used for equipment cleaning from 1967 to 1970. Personnel interviews indicated that approximately one pound per day of black powder was disposed of in a utility sink

during this same time. Other wastes such as metal shavings from O-ring drilling and used acetone-soaked rags were drummed and disposed of at the PTA Burning Ground. In the past, wastewater discharged from the air conditioning and exhaust systems, a sump pump in the basement, floor drains, and dust collectors was discharged via a drain line to the ground outside Building 209, located to the southeast of Building 210. The PTA personnel reported that this practice ceased when the building was connected to the sanitary sewer system around 1990.

Three 37.5-KVA pad-mounted transformers (TR-210) are located on the east side of Building 210. According to the PTA transformer database, all three transformers were in poor condition, but did not contain PCBs.

There are currently no plans for future construction at PICA-091 (123)/Site 62.

### 3.9.2 Previous Investigations

In 1982, four oil samples were analyzed for PCB content. All four oil sample concentrations were less than the detection limit of 31 parts per billion (ppb) for PCBs. Specific oils tested are unknown.

Closure activities at Building 210 were performed between April and May 1991. Rinsate and wipe samples from the building were analyzed for metals.

In 1993, a preliminary site evaluation that included soil sampling and a background radiation survey was conducted in the area south of Building 210 where out-of-service military vehicles had been staged. The trucks had potentially contained leaking radium gauges. Two background soil samples and twenty site soil samples were collected and analyzed to determine the presence of radium. The soil samples were collected from areas where background radiation levels were 20 R/hr or greater.

Phase II RI sampling activities were conducted between June 1995 and October 1996. The sampling program for the Phase II RI included:

- Conducting a radiological survey;
- Collecting eight surface soil samples collected at four locations;
- Collecting one subsurface soil sample and one surface soil sample from one location;

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Collecting one surface water sample;
- Collecting two sediment samples; and
- Installation of two groundwater monitoring wells. Eleven subsurface soil samples were collected at these monitoring wells, and groundwater samples were collected from each well.

### 3.9.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-18 shows the location and concentrations where one or more constituent exceeded an SC.

One surface soil sample, collected at H-62-MW-001 at a depth of 0 to 2 ft bgs, had detections of SVOCs, 2 mg/kg benzo(a)pyrene (SC = 0.2 mg/kg) and 3 mg/kg benzo(b)fluoranthene (SC = 2 mg/kg), at concentrations which exceeded their respective SC. No other constituents were detected in concentrations greater than SC.

There were no constituents detected in subsurface soil samples at Site 62 at concentrations which exceeded SC.

Three metals, mercury (SC = 0.249 mg/kg), copper (SC = 28 mg/kg), and strontium (SC = 16 mg/kg) were detected above their respective SC in at least one sediment sample. Mercury was detected in sediment samples with concentrations greater than its SC at locations H-62-SD-001 (0.90 mg/kg) and H-62-SD-002 (1.33 mg/kg). Copper was also detected with a concentration greater than its SC at H-62-SD-001 (44.30 mg/kg). Strontium was also detected with a concentration greater than its SC at H-62-SD-002 (17 J mg/kg). No other constituents were detected in sediments at concentrations greater than SC.

Thirteen metals were detected at surface water sample location H-62-SW-002 at concentrations which exceeded the respective SC. Concentrations detected were: 8630 ug/L aluminum (SC = 190 ug/L), 18.80 ug/L arsenic (SC = 1.38 ug/L), 8.38 ug/L cadmium (SC = 0.28 ug/L), 16.40 ug/L chromium (SC = 1010 ug/L), 122 ug/L copper (SC = 9.4 ug/L), 49,500 ug/L iron (SC = 1790 ug/L), 152 ug/L lead (SC = 3.2 ug/L), 579 ug/L manganese (SC = 383 ug/L), 4.21 ug/L mercury (SC = 0.05 ug/L), 5.92 ug/L selenium (SC = 5 ug/L), 7.33 ug/L silver (SC = 3.8 ug/L), 5000 ug/L sulfide (SC = 2200 ug/L), and 447 ug/L zinc (SC = 122 ug/L).

Sediment and surface water impacts in BSB areas south of the Picatinny Lake outlet were evaluated through the GPB and BSB FFS (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

There were no groundwater SC exceedances.

### 3.9.4 Summary of Risk Assessments

#### 3.9.4.1 Human Health

An HHRA was completed in 2005 for Site 62 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 62 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 7E-06/ noncarcinogenic HI of <1.
- Current Construction Worker: carcinogenic risk number of 1E-06/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.9.4.2 Lead Blood Model

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.9.4.3 Ecological

There is limited habitat at Site 62. Soil samples were collected in mowed areas. There is no cover available for terrestrial species. Thus, no ERA was conducted on the soil samples. Surface water and sediment samples were evaluated as part of BSB.

#### 3.9.4.4 Summary of Risks

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is <1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are not a concern due to limited habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### 3.10 PICA-091/Site 64 – Building 241, Loading/Disassembly Plant

#### 3.10.1 Site History

PICA-091(124)/Site 64 is located in the southern end of Area H and consists of Building 241, which is located on Fifth Avenue between Sixth Street and Sixth Court, and the former location of three transformers (TR-241) to the west of Building 241, across Fifth Avenue. Figure 3-19 shows the site layout of PICA-091 (124)/Site 64. Building 241 was constructed in 1942 as a loading plant for explosive and propellant munitions. The building was later converted for demilling and disassembly of explosive projectiles. In March 1981, the building was converted to a storehouse and office space. The last known use of the building was storage of plumbing and building supplies. The PTA file documentation indicated that historical wastewater discharges from the building were conveyed by floor drains with traps to catch basins and then into an intermittent stream that discharges into BSB. Despite extensive reconnaissance, no discharge locations were identified (Shaw 2005c).

According to the PTA transformer database the three 50-KVA pad-mounted transformers (TR-241) were in fair condition and did not contain PCBs. These transformers were removed in the 1990s as part of a facility-wide transformer disposal action (Shaw 2005c). A storage/service shed was located adjacent to the transformer pad. RCRA closure of the shed was initiated in 1991, and an additional small spill (tar with kerosene) was documented in May 1992 while the shed was awaiting final closure.

There are currently no plans for future construction at PICA-091 (124)/Site 64.

### 3.10.2 Previous Investigations

As part of the RCRA closure of the storage shed associated with Building 241, stained and discolored soil was excavated and drummed for off-site disposal. Post-excavation results were not available when the 1991 Closure Report for Building 241 – Storage Shed was submitted; therefore, the NJDEP did not approve closure. Results were provided later in the Final Phase II RI/FS Work Plan (ICFKE 1994), along with a copy of a 1992 spill report describing a small spill of tar with kerosene in the shed.

Round 1 of the Area H Phase II RI (Shaw 2005c) was conducted between December 1995 and October 1996 and involved the installation and sampling of two monitoring wells (MW-1 and MW-2), collection of a total of 15 surface and 28 subsurface soil samples, and collection of three paired surface water and sediment samples (SW/SD-1 through SW/SD-3) in an adjacent area of Bear Swamp.

Round 2 of the Area H Phase II RI was conducted between November and December 2000 and included the collection of one surface soil (SS-7A), one subsurface soil (SB-2B), and four groundwater samples (two from hydropunch borings HP-1 and HP-2, and two from the permanent wells installed during the previous round of investigation).

Seven of the surface soil samples (SS-1A, SS-2A, SS-3C, SS-4A, SS-5C, SS-6C, and SS-7A) and five of the subsurface soil samples (MW-2A, MW-2B, SB-1B, SB-1C, and SB-2B) were analyzed offsite, while the remaining soil samples were analyzed onsite during investigation activities. Off-site analysis was conducted on all groundwater, surface water, and sediment samples collected during the Phase II RI.

### 3.10.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-20 shows the location and concentrations where one or more constituent exceeded an SC.

In Site 64 surface soil samples, four SVOCs, all PAHs, were detected at concentrations greater than their SC in two of seven surface soil samples. Benzo(a)pyrene concentrations exceeded the SC = 0.2 mg/kg in surface soil samples SS-3C (5 mg/kg) and SS-7 (0.35 mg/kg). Concentrations of benz(a)anthracene (4 mg/kg), benzo(b)fluoranthene (6 mg/kg), and indeno(1,2,3-c,d)pyrene (3 mg/kg) were also detected in surface soil sample SS-3C at concentrations greater than their respective SC (2 mg/kg for each compound). Arsenic was the only metal detected at concentrations greater than its SC = 19 mg/kg in surface soil samples SS-3C (23.5 mg/kg), SS-4A (23.3 mg/kg), and SS-6C (23.2 mg/kg). No other constituents were detected in concentrations that exceeded the SC.

No constituents detected in subsurface soil samples exceeded the SC.

In sediments, the SVOCs phenanthrene and pyrene were detected at concentrations greater than their respective SC of 0.0419 mg/kg and 0.053 mg/kg, respectively, in all three sediment samples collected from the area adjacent to BSB. The respective concentrations at the sample locations were: SD-1 (phenanthrene 0.17 mg/kg and pyrene 0.26 mg/kg); SD-2 (phenanthrene 0.08 mg/kg and pyrene 0.13 mg/kg); and SD-3 (phenanthrene 0.19 mg/kg and pyrene 0.35 mg/kg). Fluoranthene was also detected at a concentration greater than its SC (0.06423 mg/kg) in sediment sample SD-3 (0.34 mg/kg). The metals copper, lead, strontium, and mercury were detected at concentrations greater than their respective SC of 28 mg/kg, 38.8 mg/kg, 16 mg/kg, and 0.249 mg/kg in all three sediment samples. Detected concentrations from the three samples ranged from 33.2 mg/kg to 71.2 mg/kg copper; 50.6 mg/kg to 95 mg/kg lead; 16.8 mg/kg to 94.5 mg/kg strontium; and 1.82 mg/kg to 11 mg/kg mercury. Zinc was also detected at a concentration greater than the SC (171 mg/kg) in sediment sample SD-3 (342 mg/kg). No other constituents detected in sediment samples exceeded the SC.

Surface water samples were co-located with sediment samples SD-1 through SD-3. The SVOC bis(2-ethylhexyl)phthalate was detected at concentrations greater than its SC = 1.2 ug/L in surface water samples SW-2 (9.1 ug/L) and SW-3 (1,000 ug/L). No other SVOCs were detected at concentrations greater than SC. Metals detected at

concentrations greater than SC in all three surface water samples include aluminum (SC = 190 ug/L), arsenic (SC = 1.38 ug/L), copper (SC = 9.4 ug/L), iron (SC = 1,790 ug/L), lead (SC = 3.2 ug/L), mercury (SC = 0.05 ug/L), and zinc (122 ug/L). Detected constituent concentrations ranged from 763 ug/L to 10,400 ug/L aluminum; 1.99 ug/L to 20.3 ug/L arsenic; 24 ug/L to 86.23 ug/L copper; 6,220 ug/L to 39,800 ug/L iron; 21.3 ug/L to 127 ug/L lead; 0.66 ug/L to 4.62 ug/L mercury; and 177 ug/L to 391 ug/L zinc. In sample SW-2, four additional metals, cadmium (5.15 ug/L), chromium (10.7 ug/L), cobalt (58 ug/L), and manganese (2,440 ug/L) were also detected at concentrations greater than their respective SC of 0.28 ug/L, 10 ug/L, 11 ug/L, and 383 ug/L. No other constituents detected in surface water samples exceeded the SC.

Sediment and surface water impacts in BSB areas south of the Picatinny Lake outlet were evaluated through the GPB and BSB FFS (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

In groundwater, the trichloroethene (TCE) was detected at a concentration greater than its SC (1 ug/L) at three sample locations, over multiple sampling events conducted between 1996 and 2008. In MW-1, TCE concentrations ranged from 1.7 to 7.4 ug/L. In MW-2, TCE concentrations ranged from 6.14 to 10 ug/L. In hydropunch sample HP-1, collected in 2000, TCE was 6.9 ug/L. Metals aluminum and iron were detected at concentrations greater than their respective SC of 200 ug/L and 300 ug/L in MW-2. In the groundwater sample collected in 1996, MW-2 concentrations of aluminum and iron were 6,300 ug/L and 2,750 ug/L, respectively. Aluminum was not analyzed again in this monitoring well; however, iron was analyzed again in 2003 and was detected at a concentration greater than the SC (340 ug/L). Manganese was detected in 1996 in MW-1 at 72.5 ug/L, which is greater than the SC = 50 ug/L. No other constituents were detected in groundwater samples at concentrations greater than SC. Groundwater in Area H is being addressed as part of the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.10.4 Summary of Risk Assessments

#### 3.10.4.1 Human Health

An HHRA was completed in 2005 for Site 64 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the

need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 64 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial/Research Worker: carcinogenic risk number of 1E-04/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 8E-07/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.10.4.2 Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### *3.10.4.3 Ecological*

Because of the forested area behind Site 64, the site was evaluated, along with adjacent Site 131, for terrestrial species. Surface water and sediment samples were evaluated as part of BSB. A soil bioassay was conducted on soil that had elevated PAH, arsenic, and beryllium concentrations. The percentage of survival in the organisms was not significantly different than the laboratory control and reference samples. Thus, the levels of chemicals in the soil samples most likely present minimal risk to populations of terrestrial species.

#### *3.10.4.4 Summary of Risks*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk range is less than or within the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is < 1;
- Lead is not a concern at this site as it is not a COPC; and

- Ecological risks are a minimal risk to populations of terrestrial species.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.11 PICA-091/Site 98 - Building 268, Mine Assembly Facility**

#### 3.11.1 Site History

PICA-091 (125)/Site 98 consists of former Building 268, which was constructed in 1941 as a loading, assembly, and pack-out facility where munitions were produced. Building 268 sits at the southern corner of Reilly Road and Eighth Street at the southern-central boundary of Area H. In 1969, Building 268 was decontaminated in accordance with an Arsenal-wide cleanup initiative and converted to a pilot-scale research and development facility. During the 1995 Phase II RI, the building was inactive and scheduled for demolition, and the building was demolished under the Toxic and Energetic Cleanup Program (TECUP) in the late 1990s (Shaw 2005c). The specific type and quantity of wastes generated during operations at Building 268 is mostly unknown except for the documented use of phosphorus (a component of mines) and Freon 113 (a solvent degreaser). The fact that explosives operations took place in Building 268 indicates that materials used and/or derivative wastes likely include scrap explosives, solvent contaminated rags (primarily acetone), and explosives contaminated wastewater. Waste streams other than wastewater in Area H were generally drummed and disposed of at the PTA Burning Ground. The transformers on the transformer pad northwest of Building 268 were removed in the 1990s as part of a facility-wide transformer removal action.

There are currently no plans for future construction at PICA-091 (125)/Site 98.

The layout of Site 98 is shown on Figure 3-21.

#### 3.11.2 Previous Investigations

The two environmental investigations conducted at Site 98 were the 1990 ARDEC investigation and the 1995 Phase II RI (Shaw 2005c). The 1990 ARDEC investigation

included the collection of soil samples and analysis of VOCs, SVOCs, and metals. The 1995 Phase II RI included the collection of ten surface soil, six subsurface soil, two sediment, and two groundwater samples for on-site analyses for VOCs, SVOCs, explosives, pesticides, PCBs, and TPH. Off-site analyses were only conducted on four surface soil samples, two sediment, two surface water, and two groundwater samples.

### 3.11.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-22 shows the location and concentrations where one or more constituent exceeded an SC.

There were no SC exceedances for any constituents in surface or subsurface soil.

SVOCs were detected in concentrations slightly greater than the SC in sediment sample H-98-SD-001 including: fluoranthene, phenanthrene, and pyrene. The source of the SVOCs is unknown, but may be related to drainage from washdown activities at upgradient Site 132 or runoff from the adjacent road. These compounds were not detected in other samples collected at Site 98 at concentrations greater than their SC. Lead was detected at concentrations greater than the SC = 38.8 mg/kg in both sediment samples. Sample H-98-SD-001 contained lead at a concentration of 57.7 mg/kg, and sample H-98-SD-002 contained lead at a concentration of 241 mg/kg. Sample H-98-SD-001 also contained mercury at a concentration of 0.47 mg/kg, which is greater than the SC = 0.249 mg/kg. Sample H-98-SD-002 contained copper at a concentration of 40.4 mg/kg, which is greater than the SC = 28 mg/kg, and strontium at a concentration of 66 J mg/kg, which is greater than the SC of= 16 mg/kg. In general, sediment and surface water impacts in BSB and Bear Swamp areas south of the Picatinny Lake outlet were evaluated through the GPB and BSB FFS (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

Groundwater samples included with this site are actually not directly on the site, but are collected from wells located to the south of the Site, across Reilly Road. The constituents historically observed at these wells with concentrations greater than their respective SC were predominantly naturally occurring metals including: aluminum (SC = 200 ug/L), arsenic (SC = 3 ug/L), iron (SC = 300 ug/L), and manganese (SC = 50 ug/L). Lead was also historically observed at concentrations in excess of the SC (5 ug/L). The most recent round of sampling (1999) indicates that the following parameters exceeded SC in well H-MWG-3B include: aluminum (850 J ug/L), iron (3300 J ug/L), and manganese (460 ug/L). Similarly, constituents detected most

recently (1999) at concentrations in excess their respective SC at well H-MWG-3A include: aluminum (2000 ug/L), iron (3300 J ug/L), and manganese (91 ug/L). Arsenic and lead were not detected in concentrations exceeding the SC in most recent samples from either well. Groundwater in Area H was evaluated and addressed through the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### 3.11.4 Summary of Risk Assessments

##### 3.11.4.1 Human Health

An HHRA was completed in 2005 for Site 98 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 98 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 1E-05/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

##### 3.11.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

##### 3.11.4.3 Ecological

The terrestrial environment at Site 98 was evaluated, along with adjacent Site 178 (Former Building 269), during the Phase II ERA. The sediment samples were treated as surface soil samples because the marsh is ephemeral. EEQs for the COPECs detected in the samples collected from Site 98 and 178 suggest there is little potential risk to small mammals, vermivorous birds and predatory birds from soil exposure at the sites. EEQs for the COPECs were less than 1 with the exception of arsenic in the white-footed mouse.

#### 3.11.4.4 Summary of Risks

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk range is within the range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are a minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### 3.12 PICA-091/Site 100 - Building 276, Explosives Loading Facility

#### 3.12.1 Site History

PICA-091 (126)/Site 100 is located in the eastern portion of Area H and consists of Building 276 and associated transformer pad TR-276. The layout of Site 100 is shown in Figure 3-23. Building 276 was constructed in 1902 and was used as a powder storage magazine from 1902 until 1922. The three-story building had a steel frame, a concrete slab foundation, and seven operation areas. Around 1922, the building was converted to a shell-loading plant. Inert rockets, M-91 fuses, and bombs were loaded in the building at various times. JB-2 propellant powder was also used here for a short period of time around 1947. Building 276 was one of the major facilities used in the production of explosives during WWI and WWII. Because explosives-related operations took place at this location, materials used and/or wastes generated are likely to include scrap explosives, waste solvents and solvent-containing rags, and

wastewaters containing explosives. Waste streams other than wastewater in Area H were generally drummed and disposed of at the PTA Burning Ground.

Unauthorized dumping of waste materials, including storage tanks, test chambers, and rocket components have occurred in and around the location of former Building 276 in the past. In addition, excavated soil impacted with explosives from the wastewater conveyance trough system at Building 225 was staged in this area.

The building was decontaminated and demolished in accordance with TECUP in the late 1980s. The former Building 276 slab was used as a staging area for soil piles from sanitary sewer excavations and for metal plates used in ammunition testing. A roof was added in 2003 to protect stored materials such as wooden boards, aluminum pipes, and generators.

The pad-mounted transformer TR-276 was located south of former Building 276. The transformer was removed in the 1990s as part of a facility-wide transformer removal action.

There are currently no plans for future construction at PICA-091 (126)/Site 100.

### 3.12.2 Previous Investigations

Three environmental investigations were conducted at PICA-091 (126)/Site 100, including an internal investigation in July 1986, the 1995 Phase II RI, and the 2000 Additional Phase II RI (Shaw 2005c).

Soil samples were collected in July 1986 as part of an internal investigation around the transformer pad in the Building 276 area. A total of six surface soil samples were collected analyzed for PCBs.

The Phase II RI was conducted between May 1995 and November 1996. This RI included a geophysical (EM61) survey, the installation of two monitoring wells, excavation of two test pits, and the collection of 12 surface soil, 21 subsurface, two sediment, and two groundwater samples. During the investigation, both on-site and off-site laboratory analyses were performed on the samples collected. Off-site analysis included VOCs, SVOCs, explosives, metals, anions, pesticides, PCBs, and TPH.

The 2000 Additional Phase II RI included installation of one new monitoring well and the collection of six surface soil samples, one subsurface soil sample, and one groundwater sample.

### 3.12.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-24 shows the location and concentrations where one or more constituent exceeded an SC.

The results of the July 1986 internal investigation reportedly indicated that surface soil around the TR-276 transformer pad was impacted with PCBs ranging from 14 to 105 ppm. During the Phase II Round 1 investigation, however, four soil samples (H-100-SS-1A to -1D) were collected around transformer pad TR-276, and no constituents exceeded the SC in these surface soil samples.

In other surface soils, benzo(a)pyrene was detected in sample H-100-MW-001 at a concentration of 0.63 mg/kg, which is just slightly greater than the SC = 0.2 mg/kg. Five PAHs, including benz(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2-c,d)pyrene were detected at concentrations greater than their respective SC (0.2 mg/kg to 2 mg/kg) in two of four surface soil samples (H-100-SS-007 and H-100-SS-008) collected just south of TR-276, with PAH concentrations ranging from 0.79 mg/kg to 7.8 mg/kg. PCBs were identified above the SC in one surface soil sample collected near the former soil waste pile area. Surface soil sample H-100-SB-2A contained 10 mg/kg of Aroclor 1260. The SC for PCBs in soil is 1 mg/kg. In order to delineate the horizontal extent of surface PCB impacts, three surface soil samples (H-100-SS-3, H-100-SS-5, and H-100-SS-6) were collected within a 10-foot radius of boring H-100-SB-2 during the Round 2 investigation and analyzed for PCBs. PCBs exceeded the SC (1 mg/kg) in three samples with concentrations ranged from 1.4 mg/kg to 8 mg/kg.

The only constituent in subsurface soil samples that exceeded SC was benzo(a)pyrene (SC = 0.2 mg/kg) at sample location H-100-SB-4 (5 to 7 ft bgs) with a concentration of 0.98 mg/kg. The EM61 preliminary electromagnetic survey indicated a large anomalous zone near the waste pile staging area (at the northwestern portion of former Building 276). Two test pits, H-100-TP-001 and HP-100-TP-2 were completed in and to the south of the former waste pile staging area, respectively. Test pit H-100-TP-001 contained various pieces of metallic construction debris, while no man-made materials

were observed in test pit H-100-TP-002. No metals were detected at concentrations greater than SC in soil samples collected from the test pits (Shaw 2005c).

In sediment, the PAHs fluoranthene (SC = 0.06423 mg/kg), phenanthrene (SC = 0.0419 mg/kg), and pyrene (SC = 0.053 mg/kg) were detected in sediment samples H-100-SD-001 and H-100-SD-002, which were collected from the swampy area to the northwest of the waste pile staging area, at concentrations greater than the SC. Mercury (SC = 0.249 mg/kg) was also detected in both sediment samples at concentrations slightly greater than the SC. Copper (SC = 28 mg/kg) was detected at a concentration of 34.7 mg/kg in sediment sample H-100-SD-001, and lead (SC = 38.8 mg/kg) and strontium (SC of= 16 mg/kg) were detected at concentrations of 65.5 mg/kg and 73 J mg/kg, respectively, in sediment sample H-100-SD-002. No other constituents were detected at concentrations that exceeded SC.

In groundwater, two naturally occurring metals (iron and manganese) were detected in monitoring well H-100-MW-001 (located to the west of former Building 276) at concentrations greater than their respective SC. No other constituents were detected in groundwater samples at concentrations greater than SC. Groundwater in Area H was evaluated and addressed as part of the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.12.4 Summary of Risk Assessments

#### 3.12.4.1 Human Health

An HHRA was completed in 2005 for Site 100 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 100 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial/Research Worker: carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 8E-07/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.12.4.2 Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### *3.12.4.3 Ecological*

Since the majority of Site 100 has been relatively inactive since the 1950s, the site has reverted to its natural condition, contiguous with a forested area. The terrestrial environment was evaluated in the Phase II ERA and the sediment samples were evaluated as part of Bear Swamp. Based upon a combination of EEQs and frequency of detection, the primary constituents contributing to potential risk in Bear Swamp appear to be pesticides and mercury. Only mercury was detected in the Site 100 samples. One aspect that is important for risk management is that surface water at some of the sample locations in Bear Swamp is intermittent in nature (such as at Site 100), and thus may not support benthic life year-round. As a result, persistent populations of benthic receptors are not expected in many of these areas, so the actual risks to benthic receptors may be less than the predicted risks. EEQs for the COPECs detected in soil samples collected at Site 100 during the Round 1 field investigation suggest there is little potential risk to small mammals, vermivorous birds, and predatory birds from soil exposure at the site. EEQs for all COPECs were less than 1 with the exception of arsenic, which is a naturally occurring metal, (4.55) in the white-footed mouse.

#### *3.12.4.4 Summary of Risk Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are a minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.13 PICA-091/Site 127 – Building 230, Melting Casting Operation**

#### 3.13.1 Site History

PICA-091 (127)/Site 127 is located on Phipps Road southwest of its intersection with Fifth Avenue (Figure 3-25). Buildings 230 and 230F are the primary structures within the site boundaries. Building 230 was constructed in 1918 as a melt and pour facility. Operations at Building 230 involved melting explosives in steel tilt kettles and pouring the molten liquid into shells, mortar, and molds. The building was last reported as active. According to PTA personnel, melt and pour operations at Building 230 generated the following waste streams: explosives contaminated wastewater, scrap explosive wastes (i.e., TNT, HMX, RDX, Composition B, octol), and small quantities of solvents (primarily acetone). Wastes were generally stored in drums and staged on concrete flooring. All waste materials, except the explosives-contaminated wastewater, are sent to the PTA Burning Ground for disposal. Explosives-contaminated wastewater was discharged to Building 225 via the trough conveyance system. Periodically, the wastewater trough was used as a temporary waste collection point. The practice of discharging wash-down water directly to the ground ceased in 1988.

Two 37.5-KVA pad-mounted transformers (TR-230) were located southeast of Building 230. According to the PTA transformer database, one of the transformers contained Aroclor-1260 at a concentration of 77 ppm. Both transformers were removed in the 1990s as part of a facility-wide transformer removal action.

There are currently plans for future construction at PICA-091 (127)/Site 127. The construction includes an Explosive Machining and Prototyping Facility near the northwest corner of Building 230 F.

#### 3.13.2 Previous Investigations

The 1991 ARDEC Discharge Investigation indicated that contact contaminated wastewater (equipment wash-down) was collected in floor troughs and discharged to

the holding tank in Building 225. Other wastewater (steam condensate) discharged to the ground.

A mercury-filled manometer in Building 230-G ruptured in September 1991, resulting in extensive soil contamination in and around Building 230-G and 230. Seven roll-off containers of contaminated soil were removed from Site 127 and confirmatory samples were collected as part of an internal investigation of the incident (ICFKE 1994).

The initial Phase II Round I RI sampling activities at Site 127 were conducted between November 1995 and October 1996. The Phase II Round I RI sampling program for Site 127 included installation of 1 monitoring well and collection of one groundwater sample, 17 surface soil samples, and 17 subsurface soil samples. During the Round I field investigation, on-site analysis was also performed on all surface soil and subsurface soil samples. These samples were analyzed on-site for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

Follow-up investigations (Round 2) were conducted between November and December 2000 based on the results of the above sampling and regulatory comments and included collection of one subsurface soil and three surface soil samples.

### 3.13.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-26 shows the location and concentrations where one or more constituent exceeded an SC.

There were no SC exceedances for VOCs, SVOCs, explosives, pesticides, or PCBs in surface soil samples. There were SC exceedances for generally naturally occurring metals in surface soils, primarily arsenic. Arsenic was detected above the SC (19 mg/kg) in three locations: H-127-SS-005A (22.70 mg/kg), H-127-SS-002A (38 mg/kg), and H-127-SS-003C (19.6 mg/kg). Manganese was detected above the SC (5,900 mg/kg) in one location: H-127-SS-003C (6,120 mg/kg).

There were no SC exceedances for VOCs, SVOCs, explosives, pesticides, PCBs, or metals in subsurface soil samples. There were no SC exceedances for VOCs, pesticides, or PCBs in groundwater samples. One SVOC, bis (2-ethylhexyl)phthalate (7.90 ug/L), exceeded the SC (3 ug/L) at location H-127-MW-001. Similarly, one slight SC exceedance for lead (5 ug/L) was observed at H-127-MW-001 with a concentration of 5.43 ug/L.

### 3.13.4 Summary of Risk Assessments

#### 3.13.4.1 Human Health

An HHRA was completed in 2005 for Site 127 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 127 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industry/Research Worker: carcinogenic risk number of 2E-05/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 3E-07/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.13.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.13.4.3 Ecological

No ERA was conducted for Site 127 because most site samples were collected in mowed areas surrounded by buildings and pavement. Little cover is available. As a result, food chain effects are unlikely.

#### 3.13.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;

- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are unlikely due to minimal ground cover.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use

### **3.14 PICA-091/Site 128 – Buildings 235/236, Explosives Pressing Plant**

#### 3.14.1 Site history

PICA-091(128)/Site 128 consists of two buildings: Building 235 and Building 236. Building 235 was an explosives production facility, and Building 236 was an explosives pressing facility. The location of these buildings is shown on Figure 3-27.

##### *3.14.1.1 Site 128, Building 235*

Building 235 was constructed in 1918 as an explosives production facility. Production activities at Building 235 involved powder mixing (mercury fulminate, lead azide, and propellant), unit density measurement, and pack-out (explosive unit stenciling and packing) activities. Explosive melt-cast operations are also known to have occurred here. According to PTA personnel, Building 235 has been inactive since the mid-1970s. The unit density equipment used at Building 235 was a gamma ray densitometer that contained cobalt pellets. The cobalt was a shielded or contained source. The densitometer was removed from the building in 1974 and no associated contamination was reported. Transformer TR-235 was formerly located east of Building 235.

According to available information, materials used, and/or derivative wastes generated at Building 235 included scrap explosive wastes, solvent contaminated rags, and explosives-contaminated wastewater. All waste materials, other than the explosives-contaminated wastewater, were generally drummed and disposed of at the PTA Burning Ground. Wastewater from explosive-production operations at Building 235 was

discharged via a trough to a 90-gallon stainless-steel baffled safety box located on the south side of the building. The safety box discharged to a small tributary that flows into BSB.

#### *3.14.1.2 Site 128, Building 236*

Building 236 is a 3,000 ft<sup>2</sup> structure, which was constructed in 1959 as an explosives pressing facility. The building was decontaminated in 1969 for its present use as a pressing facility for pilot-scale research and development efforts. Explosives-pressing operations involve hydraulic and isostatic pressing of powdered and molten explosives into bullets.

Wastes generated at Building 236 include: scrap explosives, cleaning solvents (primarily acetone), and explosives contaminated wastewater from process and wash down activities. Small quantities of hydraulic oil from the press machines may also have been generated at Building 236. Wastewater from operations at Building 236 is currently drummed and manifested for off-site disposal, but was historically discharged directly to BSB. The remaining waste streams generated at Building 236 were typically sent to the PTA Burning Ground for disposal.

There are currently plans for future construction at PICA-091 (128)/Site 128, west of the small building in the southern portion of the Site.

#### *3.14.2 Previous Investigations*

The majority of historical samples were collected from the area near Building 236.

##### *3.14.2.1 Site 128, Building 235*

The 1991 ARDEC Discharge Investigation determined that process wastewater collected in the floor trough was discharged to BSB between Buildings 235 and 232-C. Sanitary wastewater from the lavatory facilities was discharged to the sanitary sewer system. Other wastewater was discharged via a floor trough conveyance system to BSB. Non-contact wastewater (process and radiator steam condensate) was discharged to the ground and nearby swamp.

In preparation of the removal of a densitometer, wipe samples were collected. Two radiation surveys were conducted around Building 235 near two cobalt-60 sources.

### 3.14.2.2 Site 128, Building 236

The 1991 ARDEC Discharge Investigation indicated that process wastewater was drummed and manifested for off-site disposal. However, the explosive-contaminated wastewater could flow into the basement and discharge to the swamp, south of the building. Other wastewater (condensate and deluge water) was discharged to the storm sewer and eventually to the swamp located south of Building 236.

Phase II Round I RI sampling activities at Site 128 were conducted between June 1995 and October 1996. The Phase II Round I RI included a radiological survey, installation of four monitoring wells, and collection of 26 surface soil, 28 subsurface soil, and 4 groundwater samples. During the Round I field investigation, on-site analyses were performed on all surface soil and subsurface soil samples, however, these data are not discussed herein. These samples were analyzed on-site for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

Follow-up investigations (Round 2) were conducted between November and December 2000 based on the results of the above sampling and regulatory comments. This RI included the collection of five surface soil, one subsurface soil, and two groundwater samples.

### 3.14.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-28 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soil samples, one SVOC constituent, benzo(a)pyrene was detected at a concentration greater than the SC(0.2 mg/kg) at H-128-MW-002 (1.10 mg/kg). The only other parameter to exceed SC in surface soil samples is arsenic (SC = 19 mg/kg) at the following locations: H-128-SS-014 (33.6 D mg/kg); H-128-MW-002 (23.80 mg/kg); H-128-SS-002C (24 mg/kg); H-128-SS-003A (26.7 mg/kg); H-128-SS-007A (76 mg/kg); H-128-SS-008A (23.2 mg/kg); and H-128-SS-009A (51 mg/kg). No other constituents in soil were detected at concentrations greater than the SC.

In sediments, one sample location (H-SDBG-31) contained five pesticide constituents in concentrations greater than their respective SC: 4,4-DDD, USAEC LH17 at 0.53N53 mg/kg (SC = 0.00354 mg/kg), 4,4-DDE, USAEC LH17 at 0.01N01 mg/kg (SC = 0.00142 mg/kg), 4,4-DDT, USAEC LH17 at 0.04N04 mg/kg (SC = 0.00119 mg/kg),

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

Aldrin, USAEC LH17 at 0.16JN16J mg/kg (SC = 0.002 mg/kg), and endosulfan sulfate, USAEC LH17 at 0.40N40 mg/kg (SC = 0.0003 mg/kg). This sample location also contained concentrations of one PCB, Aroclor 1254 (SC = 0.06 mg/kg), and three SVOCs, fluoranthene (SC = 0.06423 mg/kg), phenanthrene (SC = 0.0419 mg/kg), and pyrene (SC = 0.053 mg/kg), which exceeded SC. The respective concentrations in sample H-SDBG-31 were: 0.95N95 mg/kg, 0.29 mg/kg, 0.18 mg/kg, and 0.42 mg/kg. This sample location also had concentrations of copper (SC = 28 mg/kg), lead (SC = 38.8 mg/kg), and zinc (SC = 171 mg/kg) that exceeded SC: 59.7 mg/kg, 94.7 mg/kg, and 197 mg/kg, respectively. No other constituents were detected in sediment samples in concentrations that exceeded SC.

In surface water samples, the pesticide alpha-BHC, was detected at a concentration that exceeded its SC of 0.0026 ug/L. The exceedance occurred at sample location H-SWBG-31, where the concentration of alpha-BHC was 0.02 ug/L.

Sediment and surface water impacts in BSB areas south of the Picatinny Lake outlet were evaluated through the GPB and BSB FFS (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

In groundwater, samples from three wells contained concentrations of constituents that exceeded SC: H-128-MW-001, H-128-MW-003, and H-128-MW-004. Concentrations of aluminum (SC = 200 ug/L) and manganese (SC = 50 ug/L) in groundwater, both of which are naturally occurring metals, exceeded SC in all three wells with concentrations ranging from 368 to 621 ug/L for aluminum and 72.8 to 104 ug/L for manganese. The 1996 groundwater sample from well H-128-MW-003 contained 16.5 ug/L lead (SC = 5 ug/L), but the most recent sample (2000) contained 6.9 ug/L lead. In well H-128-MW-004, the lead concentration in the 1996 groundwater sample was 8.06 ug/L, but in the 2000 sample was not detected. The only other constituent identified in groundwater samples from Site 128 was radium-226 (SC = 5 pCi/L) in well H-128-MW-003 at a concentration of 11.60 pCi/L; however, none of the overlying soil samples in this area contained concentrations of radium-226 that exceeded SC. Radiological constituents were not included in the list of analytes in 2000. Groundwater at this site is addressed under the Mid-Valley Groundwater action.

### 3.14.4 Summary of Risk Assessments

#### 3.14.4.1 Human Health

An HHRA was completed in 2005 for Site 128 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 128 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industry/Research Worker: carcinogenic risk number of 5E-05/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 1E-06/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.14.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.14.4.3 Ecological

Since Building 235 is surrounded by a potentially sensitive area and tributary to BSB, Site 128 was evaluated in the Phase II ERA. EEQs for sediment in the Site 128 tributary ranged from 1.0 for nickel to 133 for mercury. Based upon a combination of EEQ and frequency of detection, the primary constituent contributing to potential ecological risk in the Site 128 tributary is mercury.

One site-specific aspect that is important for risk management is that the surface water at some of the sample locations in the Site 128 tributary are intermittent in nature and thus may not support benthic life year-round. As a result, persistent populations of benthic receptors are not expected in some of the Site 128 tributary sampling locations, so the actual risks to benthic receptors may be less than the predicted risks.

EEQs for the COPECs detected in soil samples at Site 128 were less than 1 for all chemicals, with the exception of arsenic (11.8) in the white-footed mouse. Arsenic is a naturally occurring metal at Picatinny. Thus, the levels of chemicals in the surface soil samples most likely present minimal risk to populations of terrestrial receptors.

#### 3.14.4.4 *Summary of risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is <1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are minimal to terrestrial receptors due to low levels of chemicals in the surface soil samples. Based on the intermittent nature of the on-site tributary risks to benthic organisms may be over-estimated.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.15 PICA-091/Site 129 -Building 240, Change House**

#### 3.15.1 Site History

PICA-091/Site 129 consists of Building 240 (Figure 3-29). This building was constructed in 1942 as a change house and has a concrete foundation, steel frame, and a below-grade basement. In 1972, it was converted to its current use as an administrative office.

Change house equipment included laundry, lavatory, and shower facilities, which probably supported operations in Building 241 (demilling and explosives disassembly),

as well as other nearby production buildings. Because personnel working in the production facilities used the change house, wastewater from washing operations may have been contaminated with explosives and, to a lesser degree, cleaning solvents such as acetone. Water was discharged to a drain and ultimately to BSB.

There are currently no plans for future construction at PICA-091/Site 129.

### 3.15.2 Previous Investigations

No previous studies were conducted prior to the Phase II RI at Building 240. Phase II RI sampling activities at Site 129 were conducted between December 1995 and October 1996. The Phase II RI included the installation of one monitoring well and the collection of one groundwater sample, four surface soil samples, and ten subsurface soil samples. Off-site analysis was performed for TCL SVOCs, TAL metals, anions, and explosives. On-site analysis was also performed on all surface soil and subsurface soil samples. These samples were analyzed on-site for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

### 3.15.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-30 shows the location and concentrations where one or more constituent exceeded an SC.

The only current SC exceedance for any parameter in any matrix was a TCE exceedance in groundwater of 2.73 ug/L (SC = 1 ug/L) at H-129-MW-001. This exceedance was detected by the on-site laboratory. There were no detections of TCE in soils in the area, indicating that the source is no on-site source. Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.15.4 Summary of Risk Assessments

#### 3.15.4.1 Human Health

An HHRA was completed in 2005 for Site 129 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for

remedial action. The results of the HHRA calculations for carcinogenic risk at Site 129 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 8E-06/ noncarcinogenic HI of <1.
- Current Excavation Worker: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.15.4.2 Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### *3.15.4.3 Ecological*

Due to the small size and urban nature of the site, Site 129 was not evaluated in the Phase II ERA.

#### *3.15.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is <1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are minimal due to the sites' small size and urban nature.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated, this site cannot be released for unrestricted use.

### **3.16 PICA-091/Site 130 – Building 252, Powder Press/ Pelleting**

#### **3.16.1 Site History**

PICA-091/Site 130 encompasses Building 252 (Figure 3-31). This building was constructed in 1918 as an explosives pressing facility and was used until the 1990s for this purpose. Explosives-pressing operations involved forming pellets, fuses, and projectiles. Wastes generated at Building 252 included scrap explosives, waste solvents, and wastewater from operating bays, fire deluge, emergency showers, eyewash stations, and floor washdown activities. Wastes other than wastewater were typically sent to the PTA Burning Ground. Wastewater was stored in holding tanks and sent to Building 809 for treatment. In the past, however, all wastewater was discharged via a floor trough conveyance system to holding tanks, was filtered, and then discharged to BSB.

Three 37.5-KVA pad-mounted transformers (TR-252) were located on the east side of Building 252 across Sixth Avenue. According to the PTA transformer database, all three transformers leaked and were in poor condition. However, none of the transformers were contaminated with PCBs. The transformers were removed in the 1990s as part of a facility-wide transformer removal action.

Building 252 contains a UST that was connected to a wet vacuum system which collected particulates from the work station area. According to PTA personnel, the UST was closed in place around 1990. As part of closure activities, the tank was cleaned and then filled with gravel.

There are currently no plans for future construction at PICA-091/Site 130.

#### **3.16.2 Previous Investigations**

The 1991 ARDEC Discharge Investigation determined that process wastewater (floor washdown, spills, sink water, deluge) was collected in a floor trough and conveyed to a holding tank in the building. From here, the wastewater was trucked to Building 809 for treatment. Roof runoff, steam condensate, and deluge water from the east side of the building was discharged directly to the ground and to BSB.

Soil samples were collected as part of an UST closure in 1990. No additional actions were required by NJDEP. PTA personnel indicated that several other site investigations have been conducted in and around the building, including an environmental assessment conducted in 1994. It was reported that these investigations did not identify contamination; however, the specific sample locations and results are not available.

Round 1 of Phase II RI sampling was conducted between March 1996 and October 1996. It included the installation of three monitoring wells and the collection of one groundwater, seven surface soil, and nineteen subsurface soil samples. On-site analysis was performed on all surface soil and subsurface soil samples. These samples were analyzed on-site for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

Follow-up investigations (Round 2) were conducted in December 2000 based on the results of the above sampling and regulatory comments, and included the collection of one groundwater sample. This sample was analyzed for TCL VOCs.

### 3.16.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-32 shows the location and concentrations where one or more constituent exceeded an SC.

There were no SC exceedances in surface soil for VOCs, SVOCs, explosives, pesticides, or PCBs. There was one SC exceedance for arsenic (SC = 19 mg/kg) at H-130-MW-003 with a concentration of 30 mg/kg. There were no SC exceedances in subsurface soil for any contaminant analyzed.

One groundwater SC exceedance was noted at well H-130-MW-001: tetrachloroethene (PCE) was detected at a concentration of 1.6 ug/L (SC = 1 ug/L). This well was re-sampled in 2000 in conjunction with the Round 2 investigation, and no constituents were detected above SC in this round of sampling. PCE was not detected in the other groundwater samples from Site 130 nor was it detected in soil samples collected from the site. Therefore, there is no indication that PCE or other VOCs have impacted groundwater at this site. Three metals were detected in groundwater with concentrations greater than SC during the Round 1 (1996) investigation in well H-130-MW-003 including: iron at 319 ug/L (SC = 300 ug/L), lead at 8.17 ug/L (SC = 5 ug/L), and manganese at 92 ug/L (SC = 50 ug/L). Iron and manganese are naturally

occurring metals. There were no other constituents that exceeded SC. Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

Soil samples collected as part of the UST closure in 1990 indicated the presence of TNT (15 ppm) along the building's northern wall. The 1994 environmental assessment found that the building area was not contaminated.

Arsenic was detected above the 20mg/kg in the surface soil sample collected from monitoring well boring 130MW-3. The arsenic concentration in 130MW-3A was 30 mg/kg. Arsenic was not detected above SC in subsurface soil samples collected from this boring or the groundwater sample collected from the well. The relative immobility of arsenic is evidenced at Site 130 by the absence of elevated levels of arsenic in the subsurface soil samples and groundwater samples. Based on the analytical results from Site 130 during the Phase II RI, no areas of concern have been identified at the site.

#### 3.16.4 Human Health

An HHRA was completed in 2005 for Site 130 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 130 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 3E-05/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

##### 3.16.4.1 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.16.4.2 Ecological

Site 130 is dominated by Building 252, gravel, and pavement. There is limited quality habitat; thus, the site was not evaluated in the Phase II ERA.

#### 3.16.4.3 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is <1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are minimal due to building, gravel, and pavement cover.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use

### **3.17 PICA-091/Site 132, Building 271, Explosives Pressing and Loading Building**

#### 3.17.1 Site History

PICA-091(132)/Site 132 includes seven former buildings: Building 271, an explosives press loading facility, and Buildings 271-I through 271-N: lead azide primer, dry house, and general ordnance facilities (Figure 3-33). All Buildings related to 271 have been demolished as part of the TECUP program in the 1990s.

#### Site 132 Building 271, Explosives Pressing and Loading Building

Building 271 was a one-story, rectangular structure with brick walls and a slate gabled roof. The building was constructed in 1905 as a primer explosive pressing and loading

facility. Operations at Building 271 involved the use of pneumatic presses to press explosive primers (i.e., lead azide, tetryl, RDX, and HMX) into loading cups. A portion of Building 271 was also used as a magazine for in-process munitions. Explosives operations were conducted at buildings throughout Site 132 from the early 1940s until 1973.

Materials were brought into the building from satellite buildings on an as-needed basis. Wastes generated were typically off-specification explosives and explosives-contaminated wastewater from floor wash down activities. The off-specification explosive wastes were drummed and stored in "chimney barricades" (two-door lockers). The wastes were transported to Building 271-I daily, and eventually to the PTA Burning Ground for disposal.

Three 15-KVA pad-mounted transformers (TR-271) were located on the north side of Building 271. No information was available on when the transformers were removed; however, it was most likely sometime after explosives operations ceased at Building 271.

#### Site 132, Building 271-I, Lead Azide Primer Building

Building 271-I was a one-story, rectangular structure with a concrete foundation, hollow tile walls, two double-loading doors, a screened porch on four sides, and a corrugated asbestos roof. The building was constructed in 1941 as a lead azide primer building supporting explosives production operations at Building 271.

Materials used at Building 271-I included: alcohols, cleaning solvents (primarily acetone), acids, and various lead azides. The building also stored red-canned waste materials generated at surrounding Buildings 271 and 271-J through 271-M, prior to its disposal at the PTA Burning Ground. An undated waste storage inventory indicated that the following materials were stored at Building 271-I: absolute alcohol, ammonium hydroxide, antimony sulfide, barium nitrate, barium peroxide, ceric ammonium nitrate, gasoline, lead dioxide, manganese dioxide, and PB thiocyanate E sulfate. These materials were either burned or manifested for off-site disposal. Explosives-contaminated wastewater from floor wash down activities, if any, was likely discharged directly onto the ground outside the doors since Building 271-I did not have a wastewater conveyance system.

#### Site 132, Building 271-J, Dry House

Building 271-J was a one-story, rectangular structure with a concrete foundation, wood frame, and corrugated asbestos siding. The building was constructed in 1941 as a dry house for delay and pyrotechnic compositions in support of explosives production operations at Building 271. Materials used at Building 271-J included: lead azide, lead styphenate (a component used in the production of explosives from 1938 to 1973), pentaerythritol tetranitrate (PETN), tetrazene, tetryl, mercury, and acetone. Wastewater generated at Building 271-J, if any, from floor wash down activities was likely discharged onto the ground outside the doors since the building did not have wastewater troughs.

Site 132, Building 271-K, Heater House

Building 271-K was a one-story, rectangular structure with a concrete foundation, hollow tile walls, and a corrugated iron roof. The building was constructed in 1941 as a heater house.

Site 132, Building 271-L, Dry House

Building 271-L was a one-story structure with a concrete foundation, hollow tile walls, and a corrugated asbestos roof. Building 271-L was constructed in 1941 as a dry house for lead azide primers used in explosives manufacturing at Building 271. According to file documentation, Building 271-L may also have been used to dry lead styphenate, PETN, tetrazene, and tetryl. In addition, mercury and small quantities of solvents (primarily acetone) may have been used at the building. Wastewater from floor wash down activities at Building 271-L, if any, was likely discharged onto the ground outside the doors since the building had no wastewater collection system. Any other waste materials, if any, were generally red-canned, transported to Building 271-I, and disposed of at the PTA Burning Ground.

Site 132, Building 271-M, Dry House

Building 271-M was a one-story, rectangular structure with a concrete foundation, hollow tile walls, and a corrugated roof. The building was constructed sometime in the 1940s as a dry house for the processing of initiating powders. Materials used at Building 271-M are not specifically known, but probably included lead styphenate, PETN, tetrazene, tetryl, mercury, and acetone. Waste streams, other than wastewater were generally red-canned and transported to Building 271-I prior to disposal at the PTA Burning Ground. Explosives contaminated wastewater from floor wash down

activities likely discharged directly to the ground outside the doors since Building 271-M was not equipped with wastewater collection troughs.

#### Site 132, Building 271-N, Dry House

No information was available regarding the construction date of Building 271-N. The building was used for drying lead styphenate from 1938 to 1973. Materials other than lead styphenate used in Building 271-N were not specifically documented, but the explosives production operations in nearby buildings at Site 132 used alcohols, cleaning solvents (primarily acetone), acids, and various lead azides. It is likely that these materials were also used at Building 271-N. Any waste streams generated at Building 271-N, other than wastewater, were generally red-canned, transported to Building 271-I, and disposed of at the PTA Burning Ground. Wastewater generated at the building from any floor washdown activities was probably discharged onto the ground outside the doors since Building 271-N did not have a wastewater collection system.

There are currently no plans for future construction at PICA-091 (132)/Site 132.

#### 3.17.2 Previous Investigations

In 1988, 99 samples were analyzed from containers of unknown chemicals stored in Building 271-I. The wastes were generally analyzed for metals, PCBs, pH, and reactivity, sensitivity, and ignitability. The inventory indicated that the volume of waste stored varied, and the wastes were properly containerized. The wastes were eventually either burned or manifested for off-site disposition (ICFKE 1994).

The Phase II RI Round One was conducted at Site 132 between November 1995 and October 1996. This RI included the installation of two monitoring wells and the collection of 40 surface soil, 45 subsurface soil, one sediment, and two groundwater samples. Off-site analysis was completed on all matrices for the following contaminants: TCL VOCs, TCL SVOCs, TAL metals, anions, and explosives. On-site analysis was also performed on all surface soil, subsurface soil, and sediment samples. These samples were analyzed on-site for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPH.

During the follow-up investigations (Round Two) conducted between November 2000 and June 2001, 10 surface soil and 10 groundwater samples were collected.

### 3.17.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-34 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soils, there was one SVOC exceedance of benzo(a)pyrene (SC = 0.2 mg/kg) in both H-132-SS-022 (0.24 J mg/kg) and H-132-SS-022dup (0.50 mg/kg). There were several samples throughout Site 132 containing SC exceedances of arsenic with most being slight exceedances of the SC (19 mg/kg), however, the maximum arsenic concentration in surface soil was 200 mg/kg at sample H-132-SS-002C. The arsenic contamination is believed to be associated with arsenical pesticides which may have been used at the site to control insect populations. Manganese was also detected at a concentration slightly greater than its SC (5,900 mg/kg) at H-132-SS-025 with a concentration of 5,950 mg/kg. There were no other SC exceedances in surface soils.

In subsurface soils, the only metals that exceeded SC were arsenic (SC = 19 mg/kg) at H-132-MW-001 at a concentration of 21 mg/kg and manganese (SC = 5,900 mg/kg) at H-132-MW-002 with a concentration of 6,100 mg/kg. No other constituents were detected in subsurface soil at concentrations greater than the SC.

There was one SC exceedance in the sediment sample collected from Site 132. Strontium (SC = 16 mg/kg) was detected at a concentration of 17.9 J mg/kg and H-132-SD-001.

In groundwater, one explosive, RDX, exceeded the SC (222 ug/L) at H-132-MW-002 with a maximum concentration of 17.60 ug/L. RDX concentrations in overlying soils are less than SC, indicating that there is not a continuing source area at the Site. Several metals exceeded SC at several locations. Concentrations of manganese (SC = 50 ug/L) were detected at concentrations greater than the SC in six samples. Concentrations ranged from 152 ug/L at H-132-MW-001 to 43,200 ug/L at H-132-HP-003. Lead exceeded the SC (5 ug/L) at H-132-MW-001 (18.10 ug/L) and H-132-MW-002 (5.75 ug/L). Cadmium and cobalt exceeded the current SC (4 ug/L and 100 ug/L, respectively) at H-132-MW-002 with concentrations of 4.06 ug/L and 280 ug/L, respectively.

Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.17.4 Summary of Risk Assessments

#### 3.17.4.1 Human Health

An HHRA was completed in 2005 for Site 132 receptors in the Phase II RI Report. The carcinogenic risk for the reasonably anticipated future use of industrial/research worker was reassessed in 2009 and updated to include currently accepted parameters detailed in Appendix C. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 132 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial/Research Worker: carcinogenic risk number of 2E-05/ noncarcinogenic HI of <1.
- Future Construction Worker: carcinogenic risk number of 1E-06/ noncarcinogenic HI of 1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.17.4.2 Lead Blood Model Results

The current reasonably anticipated future scenarios were reevaluated at this site to reflect the current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 122 mg/kg is less than the calculated PRG of 1,092 mg/kg.
- Current Construction/Excavation Worker (subsurface soil): Lead not selected as COPC in this medium.

#### *3.17.4.3 Ecological*

TECUP operations at this large site (3.6 acres) have removed all cover and provided only marginal habitat for terrestrial species. However, Site 132 was evaluated in the Phase II ERA because it is surrounded by forested areas and may revert to a more natural state. EEQs for the COPECs detected in soil samples collected at Site 132 suggest that there is little potential risk to small mammals, vermivorous birds and predatory birds from soil exposure at the site. EEQs for all COPECs were less than 1 with the exception of arsenic (22.9), which is a naturally occurring metal, in the white-footed mouse. Results of the food chain modeling using analytical data from the soil samples indicate minimal risk to populations of terrestrial receptors.

#### *3.17.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a selected COPC in subsurface soil; and
- Ecological risks pose a minimal risk to small mammals, vermivorous birds and predatory birds from soil exposure.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.18 PICA-108/Site 90 –Building 329, Electromagnetic Gun Test Shed**

#### 3.18.1 Site History

PICA-108 (138)/Site 90 is located approximately 0.1 mile from the southern end of Picatinny Lake and includes Building 329 and six associated pad-mounted transformers. The layout of Site 90 is shown on Figure 3-35. The building was constructed in 1903 as a storage magazine, but was used in the production of explosives during WWI and WWII. Building 329 is reportedly used as an electromagnetic gun test range. Wastes typically generated at Building 329 include ethyl alcohol, oily rags, and used motor oil. Solvents and used oil generated during various historical cleaning and maintenance operations were formerly stored in two hazardous waste storage sheds located on the east side of Building 329. The storage sheds were decontaminated and closed in 1990.

In 1963, there was a production-related explosion at Building 329 that injured one person. The explosion appeared to have no environmental impact (Shaw 2005c). There were also several non-reportable quantity spills of oil in Building 329 between 1988 and 1989. According to Picatinny personnel, any oil-impacted soils were removed and properly disposed.

Three 50-KVA and three 100-KVA pad-mounted transformers were located on the east side of Building 329. According to the Picatinny transformer database, the three 50-KVA transformers had Aroclor 1260 concentrations of 183, 324, and 376 ppm. The database indicated that the three 100-KVA transformers did not contain PCBs. All six transformers were replaced with electrical boxes in the 1990s as part of a facility-wide transformer replacement/removal action. A 2,000-KVA pad-mounted transformer was located west of Building 329.

The Picatinny Master Plan (short range) includes Project 65305 for the construction of an additional building adjacent to Building 329, making use of its existing 2.5 million volt power supply to house an “RF High Voltage Weapon Propagation Tunnel.”

#### 3.18.2 Previous Investigations

Two environmental investigations were conducted at Site 90, including RCRA closure activities conducted in 1991. The Phase II RI was conducted from March through October 1996 and May and June 2003.

RCRA closure activities included decontamination of the detached sheds located east of Building 329, which were used to store solvents and used oil, and the collection of closure verification samples. Surface soil samples were collected around the perimeter of the shed as part of the closure activities. The analytical results indicated the presence of some closure parameters (VOCs and metals) above method detection limits. However, documentation from NJDEP dated December 1992 asserts that the closure areas did not require further action (Shaw 2005c).

The initial Phase II RI included installation of one groundwater monitoring well and the collection of 16 surface soil samples, 19 subsurface soil samples, one sediment sample, and one groundwater sample. During the follow-up investigation, an additional groundwater monitoring well was installed, and four surface soil, two subsurface soil, three sediment, and three groundwater samples were collected. Five of the surface soil samples (I-90-SS-001A, I-90-SS-002A, I-90-SS-003C, I-90MW-001A, and I-90-SB-001A), three of the sub-surface soil samples (I-90MW-001B, I-90-SB-001B, and I-90-SB-001C), one sediment sample (I-90-SD-001), and one groundwater sample (I-90MW-001) were collected for analysis of VOCs, SVOCs, metals, anions, fuel compounds, and explosives. The sediment sample I-90-SD-001 was also analyzed for TOC, and the groundwater sample I-90MW-001 was analyzed for pesticides. Two surface soil samples (I-90-SS-004A and I-90-SS-005A) were collected and analyzed for PCBs. Two hydropunch groundwater samples collected from I-90-HP-001 were analyzed for VOCs, SVOCs, and metals. Groundwater sample I-90MW-002, surface soil sample I-90-SS-006A, and subsurface soil samples I-90-SB-002B and I-90-SB-002C were analyzed for metals. Surface soil samples I-90-SS-007A, -008A, and -009A were analyzed for SVOCs, and sediment samples I-90-SD-001B, -002A, and -003A were analyzed for SVOCs and metals. The remaining samples were analyzed onsite only and are not discussed herein.

### 3.18.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-36 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soils, the PAH benzo(a)pyrene was detected at concentrations greater than the SC (0.2 mg/kg) in soil samples I-90-SS-008 (3.7 D mg/kg) and I-90-SS-007 (0.22 J mg/kg), which were collected north and northwest, respectively, of TR-329A. Surface soil sample I-90-SS-008 also contained three other PAHs, benz(a)anthracene (4.4 mg/kg), benzo(b)fluoranthene (4.7 mg/kg), and dibenz(a,h)anthracene (0.63 mg/kg) at

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

concentrations greater than their respective SC of 2, 2, and 0.2 mg/kg. Lead was detected in surface soil sample I-90-SS-001A, which was collected in the loading dock area of Building 329, at a concentration of 1,100 mg/kg, which exceeds the SC (800 mg/kg). Arsenic was detected in surface soil sample I-90-SB-001, which was collected to the south of TR-329, at a concentration of 22.4 mg/kg, which is greater than the SC (19 mg/kg). Surface soil sample I-90-SS-005A, which was collected adjacent to TR-329A, contained 2.5 mg/kg of Aroclor 1254, which is greater than the SC (1 mg/kg).

No subsurface soil samples contained concentrations of constituents that exceeded SC.

The four sediment samples were collected in the marsh associated with GPB located southeast of Building 329. Eleven SVOCs and five metals were reported at concentrations above SC in the sediment samples. The SVOC concentrations, which exceeded SC, were limited to samples I-90-SD-001 and I-90-SD -003: acenaphthene (SC = 0.00671 mg/kg) in I-90-SD-001 only at 2 mg/kg; anthracene (SC = 0.03162 mg/kg) in I-90-SD-001 only at 4 mg/kg; benz(a)anthracene (SC = 0.0317 mg/kg) in I-90-SD-001 at 5 mg/kg and I-90-SD-003 at 0.07J mg/kg; benzo(a) pyrene (SC = 0.0319 mg/kg) in I-90-SD-003 only at 0.09J mg/kg; benzo(b)fluoranthene (SC = 0.0272 mg/kg) in I-90-SD-003 only at 0.15J mg/kg; benzo(k)fluoranthene (SC = 0.0272 mg/kg) in I-90-SD-001 only at 5 mg/kg; chrysene (SC = 0.0571 mg/kg) in I-90-SD-001 and I-90-SD -003 at 6 mg/kg and 0.11J mg/kg, respectively; fluoranthene (SC = 0.06423 mg/kg) in I-90-SD-001 and I-90-SD -003 at 10 mg/kg and 0.15J mg/kg, respectively; fluorene (SC = 0.0212 mg/kg) in I-90-SD-001 at 2 mg/kg; phenanthrene (SC = 0.0419 mg/kg) in I-90-SD-001 at 10 mg/kg; and pyrene (SC = 0.053 mg/kg) in I-90-SD-001 and I-90-SD -003 at 10 mg/kg and 0.17 mg/kg, respectively. Arsenic exceeded the SC (16 mg/kg) in samples I-90-SD-001, -002, and -003 with respective concentrations of 17.4J mg/kg, 16.7J mg/kg, and 17.5 mg/kg. Mercury was also detected in concentrations greater than the SC (0.249 mg/kg) in these three samples with respective concentrations of 0.48 mg/kg, 0.33J mg/kg, and 0.60J mg/kg. The remaining concentrations of metals that exceeded SC were identified in sample I-90-SD-001: copper (SC = 28 mg/kg) 60.3 mg/kg; lead (SC = 38.8 mg/kg) 147.0 mg/kg, strontium (SC = 16 mg/kg) 30 mg/kg, and zinc (SC = 171 mg/kg) 396 mg/kg.

Sediment and surface water impacts in BSB areas south of the Picatinny Lake outlet were evaluated through the GPB and BSB FFS (IT 2001a) and resulting ROD GPB/BSB (USEPA 2004b).

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

In groundwater samples, one SVOC, bis(2-ethylhexyl)phthalate, was detected in I-90-HP-001 at a concentration of 100 ug/L, which exceeds the SC (3 ug/L); however, this compound was not detected at a concentration greater than the SC in the permanent monitoring well installed directly adjacent to the original sample (I-90MW-002). Several naturally occurring metals were detected in groundwater. Manganese was detected in both monitoring wells and the hydropunch well at concentrations ranging from 410 ug/L to 1,400 ug/L, which are greater than the SC (50 ug/L). Aluminum (SC = 200 ug/L) and Iron (SC = 300 ug/L) were detected at concentrations greater than their SC in the I-90-HP-001 and I-90MW-002. As is typical, concentrations of both metals were significantly greater in the I-90-HP-001 (93,600 ug/L of aluminum and 80,000 ug/L of iron) than in I-90MW-002 (1,500 ug/L of aluminum and 4,600 ug/L of iron). Also detected at concentrations greater than SC in I-90-HP-001 were arsenic (25 ug/L, SC = 3 ug/L), beryllium (1.8 J ug/L, SC = 1 ug/L), chromium (110 ug/L, SC = 70 ug/L), and lead (120 ug/L, SC = 5 ug/L). Lead was also detected in several groundwater samples from surrounding sites, at concentrations slightly greater than the SC.

### 3.18.4 Summary of Risk Assessments

#### 3.18.4.1 Human Health

An HHRA was completed in 2005 for Site 90 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 90 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 6E-05/ noncarcinogenic HI of <1.
- Future Industrial Worker: carcinogenic risk number of 1E-06/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.18.4.2 Lead Blood Model Results*

The current reasonably anticipated future scenarios were reevaluated at this site to reflect the current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 246 mg/kg is less than the calculated PRG of 1,092 mg/kg.
- Current Construction/Excavation Worker (subsurface soil): Lead not selected as COPC in this medium.

#### *3.18.4.3 Ecological*

Site 90 was not evaluated in the Phase II ERA because it is predominately covered by Building 329 and pavement. The grassy area in the front of the building is regularly mowed. In addition, the soil samples were collected in areas with little or no habitat quality (i.e., beneath the loading dock, adjacent to transformer pads and along railroad tracks).

#### *3.18.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is less than the PRG;
- Ecological risks are expected to be minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.19 PICA-108/Site 111 –Buildings 454 & 455 Propellant Bag Filing Area**

#### 3.19.1 Site History

PICA-108 (104)/Site 111 includes Buildings 454 and 455 and encompasses an area of approximately three acres within Area F. The location of Site 111 is shown on Figure 3-37. Building 454 is a two-story steel-framed structure constructed in 1930 and modernized in 1941 when the second floor, catwalks, and platforms were installed. The building was used for filling dyed cloth bags with black powder. In 1970, the bag filling operation was mechanized with black powder conveyors and automated bag weighing machines. In addition, an automatic bag loading pilot line was installed. According to interviews with Picatinny personnel, bags sometimes fell to the floor during the filling operation causing black powder to be spilled onto the floor. The floor was reportedly swept up after each shift (Shaw 2005e). Building 455 is a one-story structure with a concrete foundation, hollow tile walls, and a gable roof. The building was constructed in 1930, and contained sewing machines where workers sewed silk and cotton bags for use in propellant loading operations at Buildings 454 and 462.

The Picatinny Master Plan includes the construction of a Packaging, Handling, Shipping and Transportation facility at the northern portion of Site 111. The area slated for this facility includes the area adjacent to the north and western sides of Building 455. The project is identified in the short term plan as PN65425 and consists of the building for the facility, as well as an outdoor test area which will accommodate Navy personnel and mission being realigned from Earle, NJ. The Master Plan indicates that the building is at the corner of Babbitt and Whittmore Roads and that land use controls will be recommended for contaminated soils in the vicinity.

#### 3.19.2 Previous Investigations

As part of the Phase I RI (Dames and Moore 1998), eight surface soil samples (F-SS111-1 through F-SS111-8) were collected and analyzed for VOCs, SVOCs, explosives, metals, and cyanide. Two of the surface soil samples (F-SS111-5 and F-SS111-8) were also analyzed for pesticides and PCBs.

The Phase I 2A/3A RI Sampling Program (Shaw 2005e) was conducted from August 2000 through June 2001. During this RI, nine surface soil samples (F-111-SS-9B, F-111-SS-10A through -15A, F-111-SS-16B, and F-111-SS-17A) and one subsurface soil sample (F-111-SB-1A) were collected and analyzed for PAHs.

### 3.19.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-38 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soils, five PAHs were identified in concentrations that exceeded the SC including: benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2,3-c,d)pyrene (SC = 2 mg/kg). The maximum concentrations for each of these parameters were located at one sample location: F-111-SS-014 with respective concentrations of: 26 mg/kg, 24 mg/kg, 30 mg/kg, 3.4 J mg/kg, and 15 mg/kg. The other sample locations containing PAH exceedances include: F-SS111-6, F-111-SB-001, F-111-SS-009, F-111-SS-010A, F-111-SS-012, F-111-SS-013, F-111-SS-015, F-111-SS-016, F-111-SS-017, and F-SS111-1. Arsenic (SC = 19 mg/kg) was detected in surface soil sample F-SS111-1 at a concentration of 21.5 mg/kg. Dieldrin (SC = 0.2 mg/kg) was detected in surface soil sample F-SS111-5 at a concentration of 0.94 mg/kg. No other constituents were detected in surface soils in concentrations greater than the SC.

Benzo(a)pyrene was the only PAH detected at a concentration greater than the SC in subsurface soil in sample F-111-SB-001 (0.82 mg/kg).

Groundwater samples collected from monitoring wells F-MWF-2A and F-MWF-2B between 1994 and 2008 contained concentrations of TCE and PCE greater than the SC, both of which are 1 ug/L. Concentrations of PCE ranged from non-detect to 1.3 ug/L, and concentrations of TCE ranged from 1.93 ug/L to 7.4 ug/L. Naturally occurring manganese (in filtered and non-filtered samples) was detected at concentrations greater than the SC (50 ug/L) in both monitoring wells, at concentrations ranging from 107 ug/L to 904 ug/L. Naturally occurring aluminum and iron (filtered and non-filtered) were also detected in F-MWF-2A at concentrations greater than their respective SC (200 ug/L and 300 ug/L). Lead (SC = 5 ug/L) was detected in F-MWF-2A in two samples at concentrations of 6.87 ug/L and 6 ug/L. Dieldrin (SC = 0.03 ug/L) was detected in one 1994 sample of F-MWF-2A at a concentration of 0.04 ug/L.

Groundwater in Area F is addressed through the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### 3.19.4 Summary of Risk Assessments

##### 3.19.4.1 Human Health

An HHRA was completed in 2005 for Site 111 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 111 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial/Research Worker: carcinogenic risk number of 5E-05/ noncarcinogenic HI of <1.
- Future Maintenance Worker: carcinogenic risk number of 4E-06/ noncarcinogenic HI of <1.
- Future Construction Worker: carcinogenic risk number of 2E-05/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

##### 3.19.4.2 Lead Blood Model Results

The current reasonably anticipated future scenarios were reevaluated at this site to reflect the current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 182 mg/kg is less than the calculated PRG of 1,092 mg/kg.

- Current Construction/Excavation Worker (total soil): No concern - average lead concentration of 182 mg/kg is less than the calculated PRG of 1,092 mg/kg.

#### 3.19.4.3 Ecological

No ERA was performed at Site 111. The majority of the area is paved, and railroad tracks run in front of Building 454 and behind Building 455. The site is located within a high human use, highly-industrialized part of PTA. Thus, very little suitable habitat exists for most species and ecological exposures are expected to be minimal.

#### 3.19.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as the average concentration is less than the PRG; and
- Ecological risks are expected to be minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### 3.20 PICA-108 /Site 137 – Building 382, Administration Building

#### 3.20.1 Site History

PICA-108 (147)/Site 137 is located northwest of GPB and southeast of Picatinny Lake in the southwestern corners of Area I, and includes Building 382 and three associated pad-mounted transformers (TR-382). Site 137 is approximately 1.0 acre in size. The

location of Site 137 is shown on Figure 3-39. Building 382 was constructed in 1942 as a general-purpose administration building and is still used for that purpose.

Three 37.5-KVA transformers were located near the northeast corner of Building 382. According to the Picatinny transformer database, all three transformers were in poor condition, but did not contain PCBs. These transformers were replaced with new transformers in the late 1990s as part of a facility-wide transformer replacement/removal action.

There are currently no plans for future construction at PICA-108 (147)/Site 137.

### 3.20.2 Previous Investigations

Initial Phase II RI sampling activities at Site 137 were conducted between May 1995 and November 1996. This sampling program consisted of a geophysical survey, installation of two monitoring wells (I-137-MW-001 and I-137-MW-002) and three test pits (I-137-TP-001, -002, and -003), and collection of nine surface soil, eighteen subsurface soil, and two groundwater samples. Follow-up investigations were conducted between May and June 2001 and included collection of nine surface soil and nine subsurface soil samples. Three surface soil samples (I-137-MW-001A, I-137-MW-002A, and I-137-SB-001A), two subsurface soil samples (I-137-MW-001B and I-137-MW-002B), and two groundwater samples were collected for off-site analyses for VOCs, SVOCs, metals, anions, and explosives. One surface soil sample, I-137-SS-001A, was collected for off-site analysis of PCBs. Surface and subsurface soil samples collected from the test pits were collected for off-site analysis of metals. Follow-up surface and subsurface soil samples I-137-SS-004A through -006A and -009A, I-137-SB-002A through -005A, I-137-SB-002C, I-137-SB-003B/C, I-137-SB-004B/C, and I-137-SB-005B/C were collected for off-site analysis of arsenic. Follow-up surface soil sample I-137-SS-003A and subsurface soil sample I-137-SS-002C were collected for off-site analysis of SVOCs. The remaining soil samples were analyzed onsite; on-site sample analytical data are not discussed herein.

### 3.20.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-40 shows the location and concentrations where one or more constituent exceeded an SC.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

Only one SVOC, benzo(a)pyrene, was detected in surface soil samples at a concentration greater than the SC (0.2 mg/kg). The concentration of benzo(a)pyrene at location I-137-SB-001 was 1 mg/kg. Arsenic (SC = 19 mg/kg) was the only other constituent detected in surface soil samples in concentrations greater than the SC ranging from 20.9 mg/kg to 110 mg/kg at locations: I-137-MW-001, I-137-MW-002, I-137-SB-001, I-137-SB-003, I-137-SB-004, and I-137-SS-006.

In subsurface soils, five SVOCs, benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2-c,d)pyrene (SC = 2 mg/kg), were detected at concentrations greater than their respective SC. All the subsurface soil SC exceedances occurred in subsurface soil sample I-137-SS-002 with respective concentrations of: 9.6 mg/kg, 9.4 mg/kg, 12 mg/kg, 1.3 mg/kg, and 4.5 mg/kg. Arsenic was detected at concentrations greater than the SC (19 mg/kg) in subsurface soil samples I-137-TP-003, I-137-SB-003, and I-137-SB-004 with concentrations ranging from 32.1 mg/kg to 210 mg/kg. No other constituents were detected in subsurface soils at concentrations greater than the SC.

In groundwater, TCE (SC = 1 ug/L) was detected in monitoring well I-137-MW-002 at a concentration of 1.9 ug/L. TCE was not detected at a concentration greater than the SC in groundwater samples from closely surrounding sites. Lead (SC = 5 ug/L) was detected in monitoring well I-137-MW-001 at a concentration slightly greater than the SC (5.99 ug/L). Lead was also detected in several groundwater samples from surrounding sites, at concentrations slightly greater than the SC. Three naturally occurring metals, aluminum (SC = 200 ug/L), iron (SC = 300 ug/L), and manganese (SC = 50 ug/L), were detected in groundwater from well I-137-MW-001 at concentrations greater than their SC with concentrations of 5430 ug/L, 15,700 ug/L, and 3010 ug/L, respectively. No other constituents were detected in groundwater samples at concentrations greater than SC.

### 3.20.4 Summary of Risk Assessments

#### 3.20.4.1 Human Health

An HHRA was completed in 2005 for Site 137 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for

remedial action. The results of the HHRA calculations for carcinogenic risk at Site 137 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 6E-05/ noncarcinogenic HI of <1.
- Future Construction Worker: carcinogenic risk number of 1E-05/ noncarcinogenic HI of 1.

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.20.4.2 Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### *3.20.4.3 Ecological*

Since Building 382 dominates this 1.0 acre site, ecological habitat is limited to the mowed areas with scattered trees. Thus, no ERA was conducted due to the urban nature of the site.

#### *3.20.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 and 1E-04;
- The noncarcinogenic hazard is less than or equal to 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are expected to be minimal due to limited habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.21 PICA-108/Site 139 –Building 424, Propellant Processing Plant**

#### 3.21.1 Site History

PICA-108/Site 139 includes Building 424 and is located 1,000 ft southwest of Picatinny Lake. The layout of Site 139 is shown on Figure 3-41. Building 424 was constructed in 1903 as a high explosives plant. In 1940, an addition to the building was constructed to house wooden neutralization and acid tanks.

As a high-explosives plant, operations at Building 424 involved the use of a nitrocellulose based slurry. After production of explosives ceased, all production equipment was removed except for the neutralization and acid tanks. The building was then used as a grains-dimensioning laboratory and as a storage facility. Recently, Building 424 was used for nitration and testing of combustible cartridge cases. The building is inactive and was scheduled for demolition along with Buildings 424C and 424D in 2003.

According to a 1964 DEH engineering drawing (DP141463), a sump located inside Building 424 was used for the collection of overflow production water. The sump discharged to the marsh area southwest of the building via an open trough and a small outfall ditch.

The ANL RI Concept Plan indicated that a pipeline at Building 424 broke sometime in the 1950s and spilled a slurry of single-base propellant and nitrocellulose. The ANL report also indicated that spill control pits were constructed at Building 424 to divert the flow of washdown water away from the building toward the southeast. The exact location of the pits was not available.

The ditch located to the south of Building 424 is associated with the open trench portion of the Guncotton Line (Site 16), which received liquid waste containing nitrocellulose.

There are currently no plans for future construction at PICA-108/Site 139.

### 3.21.2 Previous Investigations

The 1993-1994 Phase I RI included seven surface soil samples, two subsurface soil samples, two surface water samples, two sediment samples, and four groundwater samples. All samples were analyzed for VOCs, SVOCs, explosives, and metals plus cyanide. Two surface soil samples, one subsurface sample, and one surface water and sediment sample were also analyzed for pesticides and PCBs.

During the Phase II RI, eight sediment samples were collected from the drainage ditch of Building 424.

Field activities for the Phase I 2A/3A were conducted at Site 139 between September 2000 and February 2002. The sampling program included installation of one monitoring well and the collection of twenty surface soil, three subsurface soil, six surface water, one groundwater, and fourteen sediment samples. In 2004, an oil-water separator and the concrete pad it sat on were removed from outside Building 424, just south of the eastern corner of the building. Soils in the area were excavated to a depth of 4 ft bgs until post-excavation confirmation samples showed the impacted area had been successfully removed. Approximately five cubic yards of soil were removed from the excavation.

The Facility-Wide Lead Removal Investigation activities took place between June and September 2004. As part of this investigation, the neutralization tank was drained of approximately 1,759 gallons of water, which were sampled and analyzed for disposal characterization and disposed as non-hazardous waste. The neutralization tank was then removed, and approximately 89 cubic yards of lead containing soil was excavated from the area of the tank, to a depth of 5 ft bgs. Lead and select SVOCs were detected at concentrations exceeding SC in initial post-excavation samples. An additional foot of soil was excavated from the north and west sidewalls, as well as the excavation bottom. Lead and SVOCs were not detected at concentrations greater than SC in post excavation samples collected after the additional soil removal. The excavated soil was staged at the former location of Building 1033 until it could be disposed of offsite, and the excavation was backfilled with clean soil.

### 3.21.3 Nature and Extent of Contamination

The analytical data available in the Picatinny data base are included in Appendix A. Sample locations where the SC are exceeded in soil and groundwater are shown on

Figure 3-42. Sample locations where the SC are exceeded in surface water and sediment are shown on Figure 3-43.

In surface soils, four SVOCs, benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg) and dibenz(a,h)anthracene (SC = 0.2 mg/kg), were detected in at least one surface soil sample at concentrations greater than SC. The maximum concentration of benz(a)anthracene, 2.9 mg/kg, was detected at location F-SS139-4. The maximum concentration of benzo(a)pyrene, 0.93 mg/kg, was detected at location F-139-SS-012. The maximum concentrations of benzo(b)fluoranthene and dibenz(a,h)anthracene, 2.9 mg/kg and 1.3 mg/kg, respectively, were detected at location F-SS139-4. The explosive 2, 4-DNT (SC = 4.2) was detected in one surface soil sample: 4.84 mg/kg at F-SS139-6. In addition, 14 D mg/kg Aroclor 1260 was detected in sample F-SS139-6, and 8.2 D mg/kg 4, 4'-DDT (SC = 8 mg/kg) and 16 D mg/kg Aroclor 1260 (SC = 1 mg/kg) were detected in the duplicate from sample location F-SS139-6. These three constituents were not detected at concentrations greater than SC in any other soil samples at Site 139. One pesticide, dieldrin, USAEC LH17 (SC = 0.2 mg/kg), was detected at a concentration of 0.87 mg/kg at sample location F-SS139-1, however, dieledrin USAEC LM 25 was not detected at the same sample location. Mercury (SC = 65 mg/kg) was also detected only at this sample location, at a concentration of 70 D mg/kg. Lead (SC = 800 mg/kg) was detected at concentrations greater than its SC in six surface soil samples. The maximum concentration was 24,000 D mg/kg at sample location F-SS139-4 (collected in 1993); however, additional soil samples were collected in August 2000 at and around this location to confirm and further delineate lead concentrations in this area. Lead concentrations in the August 2000 samples were significantly less than the maximum concentration. Based on the August 2000 samples, it appears that the reported result for F-SS139-4 was an anomaly and that it is unlikely that lead is present at the concentration reported for F-SS139-4. In the other five surface soil samples with concentrations of lead greater than the SC, the maximum concentration was 2,010 D mg/kg, at sample location F-139-SS-018. No other constituents were detected in concentrations that exceeded SC in surface soils.

In subsurface soils, mercury was detected at a concentration greater than its SC (65 mg/kg) in one location: F-139-SB-002 at a depth of 2.5-3 ft bgs with a concentration of 175 JD mg/kg. One subsurface soil sample detected lead at a concentration that exceeded the SC at location F-139-SB-002, 2.5-3 ft bgs (1290 J mg/kg). There were no other constituents detected in subsurface soils at concentrations greater than SC.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

For sediments at Site 139, four samples had concentrations of at least one SVOC greater than the SC. Maximum concentrations of 4.9 mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 6.6 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 3.1 mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 15 mg/kg di-n-butylphthalate (SC = 11 mg/kg), 5 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.76 mg/kg fluorene (SC = 0.0212 mg/kg), 3.3 mg/kg phenanthrene (SC = 0.0419 mg/kg), and 5.5 mg/kg pyrene (SC = 0.053 mg/kg) were detected at location F-SD139-2. The maximum concentration of 0.41 J mg/kg benzo(a)pyrene (SC = 0.0319) was detected at location F-139-SD-009. Indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg) was only detected above its SC in one sediment sample, F-139-SD-009, at a concentration of 0.29 J mg/kg. Chrysene was detected in four sediment samples at a concentration greater than its SC (0.0571 mg/kg), with a maximum at F-SD139-1 (6.6 mg/kg).

Two sediment samples contained concentrations of 2,4-DNT (SC = 4.2 mg/kg) that exceeded the SC: 260 D mg/kg at F-139-SD-004 and 320 D mg/kg at F-139-SD-005. Five pesticides, 4,4'-DDD (SC = 0.00354 mg/kg), 4,4'-DDE (SC = 0.00142 mg/kg), 4,4'-DDT (SC = 0.00119 mg/kg), Heptachlor epoxide (SC = 0.0006 mg/kg), and methoxychlor (SC = 0.006 mg/kg), were detected in at least one sediment sample at a concentration greater than the SC. Maximum concentrations of 11 D mg/kg 4,4'-DDD and 0.9 D mg/kg 4,4'-DDE were detected at F-139-SD-009; 0.32 JD mg/kg 4,4'-DDT and 0.01 JD mg/kg methoxychlor (duplicate sample) were detected at F-139-SD-012; and 0.81 N mg/kg heptachlor epoxide was detected at F-SD139-2.

Eleven predominantly naturally occurring metals were detected in sediment samples at concentrations greater than the SC. Maximum concentrations of 30.3 J mg/kg arsenic (SC = 16 mg/kg), 304 J mg/kg nickel (SC = 39.6 mg/kg), 11.9 J mg/kg silver (SC = 1 mg/kg), and 1330 J mg/kg vanadium (SC = 1000 mg/kg) were detected at location F-139-SD-004. Maximum concentrations of 4.1 J mg/kg cadmium (SC = 1.7 mg/kg), 2260 J mg/kg copper (SC = 28 mg/kg), and 1140 J mg/kg zinc (SC = 171 mg/kg) were detected at location F-139-SD-006. Lead was detected at thirteen sediment sample locations at concentrations greater than the SC (38.8 mg/kg); the maximum concentration was 1710 J mg/kg at location F-139-SD-008. The maximum concentration of chromium (SC = 37.3 mg/kg) was detected in a duplicate sample from F-139-SD-012 at a concentration of 266 J mg/kg. The maximum concentrations of 3.98 mg/kg beryllium (SC = 2 mg/kg) and 110 D mg/kg mercury (SC = 0.249 mg/kg) were detected at F-SD139-1. No other constituents exceeded SC in sediment samples.

In surface water samples, one SVOC was detected at one sample location with a concentration greater than its SC, 1.2 J ug/L pentachlorophenol (SC = 0.27 ug/L) at

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

location F-139-SW-008. Concentrations of three pesticides, 0.02 J ug/L 4,4'-DDD (SC = 0.00031 ug/L), 0.02 J ug/L 4,4'-DDE (SC = 0.00022 ug/L), and 0.01 J ug/L 4,4'-DDT (SC = 0.00022 ug/L), were detected at concentrations greater than the SC at sample location F-139-SW-010A. Maximum concentrations of 14,700 J ug/L aluminum (SC = 190 ug/L), and 7.4 ug/L selenium (SC = 5 ug/L) were also detected at this sample location. Maximum concentrations of 6.3 J ug/L antimony (SC = 5.6 ug/L), 23 ug/L arsenic (SC = 1.38 ug/L), 7.5 ug/L cadmium (SC = 0.28 ug/L), and 950 ug/L zinc (SC = 122 ug/L) were detected at sample location F-139-SW-008. Maximum concentrations of 40.1 ug/l chromium (SC = 10 ug/L), 35 ug/L cobalt (SC = 11 ug/L), 365 ug/L copper (SC = 9.4 ug/L), 40,200 ug/L iron (SC = 1790 ug/L), 2500 D ug/L lead (SC = 3.2 ug/L), 853 ug/L manganese (SC = 383 ug/L), 120 D ug/L mercury (SC = 0.05 ug/L), 295 ug/L nickel (SC = 52 ug/L), and 443 ug/L vanadium (SC = 37 ug/L) were detected at surface water sample location F-SW139-1. No other constituents were detected with concentrations greater than the SC in surface water.

In groundwater, two VOCs, 4.7 ug/L bromodichloromethane (SC = 1 ug/L) and 4.2 ug/L dibromochloromethane (SC = 1 ug/L), were detected from sample location F-139-MW-001. One SVOC, 4.5 J ug/L bis(2-ethylhexyl)phthalate (SC = 3 ug/L), and one inorganic, 56,800 ug/L sodium (SC = 50,000 ug/L), were also detected at this sample location.

Seventeen predominantly naturally occurring metals were detected in groundwater samples at Site 139. The maximum concentration of 130 D ug/L mercury (SC = 2 ug/L) was detected in samples from two locations: F-HP139-5 and F-HP139-1. The maximum concentration of 16.6 ug/L arsenic (SC = 3 ug/L) was also detected at F-HP139-1. Antimony (SC = 6 ug/L) at a concentration of 67.8 ug/L, cobalt (SC = 100 ug/L) at a concentration of 1,330 ug/L, and manganese (SC = 50 ug/L) at a concentration of 72,000 ug/L were detected in groundwater collected from location F-HP139-2. Maximum concentrations of 1,100,000 D ug/L aluminum (SC = 200 ug/L), 9,960 ug/L barium (SC = 2,000 ug/L), 59.8 ug/L beryllium (SC = 1 ug/L), 16.5 ug/L cadmium (SC = 4 ug/L), 1,500 D ug/L chromium (SC = 70 ug/L), 5,080 ug/L copper (SC = 1,300 ug/L), 3,400,000 D ug/L iron (SC = 300 ug/L), 21,000 D ug/L lead (SC = 5 ug/L), 1,880 ug/L nickel (SC = 100 ug/L), 2,790 ug/L vanadium (SC = 260 ug/L), and 6,780 ug/L zinc (SC = 2,000 ug/L) were all detected at groundwater sample location F-HP139-4. No other constituents were detected at concentrations greater than SC for groundwater samples collected for Site 139.

The constituents at Site 139 which are present at concentrations greater than SC have been evaluated and addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.21.4 Summary of Risk Assessments

#### 3.21.4.1 Human Health

An HHRA was completed in 2005 for Site 139 receptors and provided previously in the Phase II RI Report and the Dames and Moore Phase I HHRA. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 139 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.
- Future Construction Worker: carcinogenic risk number of 6E-07/ noncarcinogenic HI of 3. However, while the total hazard index for all target endpoints or effects combined is 3, after segregating the estimated target indices for each compound by common target organ or effect in accordance with USEPA guidance (USEPA 1989), the hazard index for each target organ/effect is less than or equal to one, which indicates that adverse noncancer effects are not expected to occur. The HI for each target organ/effect is less than or equal to 1, which indicates that adverse noncancer effects are not expected.

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- On-site Youth Visitor: carcinogenic risk of 2E-05/ noncarcinogenic HI of 1.

#### 3.21.4.2 Lead Blood Model Results

The current reasonably anticipated future scenarios were reevaluated at this site to reflect the current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker (surface soil): No concern: average lead concentration of 835 mg/kg is less than the calculated PRG of 1,092 mg/kg.
- Current Construction/Excavation Worker (Total Soil): Average lead concentration of 1,397 mg/kg is greater than the calculated PRG of 1,092 mg/kg. However, this average concentration has not been recalculated subsequent to the resampling event in 2000, which was unable to reproduce the high lead concentrations originally observed. Risks to construction workers can be managed with health and safety equipment. This receptor is not considered to drive the remedy.

Current human health risks associated with lead exposures under not reasonably anticipated future use scenarios are:

- Current On-site Youth Visitor (sediment): No concern – average lead concentration of 821 mg/kg, less than PRG or 1,092 mg/kg.

#### *3.21.4.3 Ecological*

Site 139 is less than 0.4 acres. However, it was evaluated in the Phase III Baseline ERA (BERA) as part of the Area F investigation. As part of that investigation, potential risks associated with sediments and surface water at the site were evaluated through benthic community surveys and wildlife exposure modeling. Although the dose modeling suggested some potential risks to terrestrial species, no significant adverse effects on-site ecological communities were found, demonstrating that evaluation of sediment, soil, and surface water concentrations alone may not fully account for the site-specific bioavailability and ultimate toxicity of COPEC to receptors at the site. Based on the data collected, the overall weight of evidence indicated no significant effects on ecological populations.

Ecological risks are possible, although unlikely, at the site. Possible ecological risks do not appear to be unacceptable based on benthic community surveys and wildlife exposure modeling and thus, given the limited quality of the available habitat, remedial action is not necessary to address these potential ecological risks.

#### *3.21.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the range of 1E-06 and 1E-04;

- The noncarcinogenic hazard is less than 1 for industrial use workers; less than or equal to 1 (by endpoint); and
- Lead is not a concern following removal actions at this site, and
- Ecological risks at the sites are expected to be minimal.

For hypothetical On-site Youth Visitor risk scenarios, risks are within the generally acceptable risk range of 1E-06 to 1E-04 and HI of 1. Additionally, lead is not a concern for the On-site Youth Visitor scenario.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.22 PICA-108/Site 140 –Buildings 427 and 427B, Propellant Processing Plant**

#### 3.22.1 Site History

PICA-108 (109)/Site 140 consists of Buildings 427 and 427B. The layout of Site 140 is shown on Figure 3-44. The two buildings are located in Area F. Building 427 was built in 1938 and is part of the 400-Area Experimental Pyrotechnics District. Until recently, Building 427 has served as a manufacturing plant for propellants. According to PTA personnel, materials used in the building included energetic materials and solvents.

The last reported use of Building 427 was for propellant research. Wastes associated with Building 427 activities are stored either in one of the two catch tanks in the building or on the building floor. PTA personnel reported that the catch tanks have been used since 1981. Generated wastes consist of 200 pounds per year (lb/yr) of rags; 55 gallons per year (gal/yr) of contaminated alcohol, acetone, ethyl acetate, or ether; 270 lb/yr of scrap propellant; and 60 lb/yr of excess propellant. An open drain surrounding Building 427 runs into two concrete-lined pits, located southwest of Building 427. Both pits are currently sediment-filled and the pipes that reportedly drained and discharged on the ground surface about 80 ft southwest of the building are no longer present. PTA personnel reported that the building was flushed with a great deal of water in the last few years (prior to 1998); therefore, the lined pit contains sediment that may be contaminated.

Building 427B has an area of 960 square ft and is located approximately 100 ft southeast of Building 427. Building 427B was erected in 1939 for use as a dry house. It is currently used as an explosives storage magazine. The interior of the building is divided into storage space and three rooms where HMX, RDX, and other types of smokeless powders were dried before being processed into propellants in Building 427. The floors are covered with a conductive material, and the doorways are sided with metal.

Building 427B had a wheel air compressor leak on June 25, 1992. This leak was cleaned up with a 5-gallon pail of peat moss. In addition, Building 427 discharges wastes from a laboratory sink and hood into the ground southwest of the building.

There are currently no plans for future construction at PICA-108 (109)/Site 140.

#### 3.22.2 Previous Investigations

The RI consisted of a UXO survey and the collection of three surface soil and two sediment samples. The sediment samples were collected from the two concrete pits. All soil samples were collected from a depth of 0 to 1 ft bgs, using a hand auger. Each of the samples was then divided into two parts. Soil from 0 to 0.5 ft bgs was analyzed for BNAs, TAL metals, cyanide, and explosives. Soil from 0.5 to 1 ft bgs was analyzed for TCL VOCs. The top portion of sample SS140-2 was analyzed for pesticides/PCBs.

Two sumps near Site 140 - Building 427 were investigated by digging test trenches and analyzing soil samples in 2004. The conclusion of this sampling event was that the soil from the test trenches was returned to excavations and the Site was recommended for closure with no further action.

#### 3.22.3 Nature and Extent of Contamination

Areas where SC are exceeded are shown on Figure 3-45. The data that are available in the Picatinny database are included in Appendix A.

In surface soil, 2,4-DNT (SC = 4.2 mg/kg) was the only constituent detected in concentrations greater than its SC in the sample from location F-SS140-2 with a concentration of 4.6 mg/kg (USAEC LM 25) and 22.4 mg/kg (USAEC LW23). In subsurface soil, arsenic (SC = 19 mg/kg) was detected at a concentration of 53 D mg/kg at location F-SB140-3 at a depth of 4-6 ft bgs. No other constituents were detected in subsurface soil samples.

### 3.22.4 Summary of Risk Assessments

#### 3.22.4.1 Human Health

An HHRA was completed previously as part of the Phase I Risk Management Plan (2000). The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 140 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Outdoor Maintenance Worker: carcinogenic risk number of 2E-06/  
noncarcinogenic HI of <1.
- Future Industrial/Research Worker: carcinogenic risk number of 3E-05/  
noncarcinogenic HI of <1.
- Future Construction/Excavation Worker: carcinogenic risk number of 7E-06/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.22.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.22.4.3 Ecological

No ERA was performed for Site 140 ecological risks because of its limited ecological habitat.

#### 3.22.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the range for the outdoor maintenance worker, industrial/research worker, and construction worker generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than 1 for the outdoor maintenance, industrial/research and construction workers;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are not a concern because of its limited ecological habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.23 PICA-108/Site 210 –Building 321, Former Storehouse\Currently Administration Offices**

#### **3.23.1 Site History**

PICA-108/Site 210 consists of Building 321. The building is a one-story concrete and brick structure located in the Powder Production Area. This 1903 structure originally served as a storehouse for fuzed projectile “O.” The building was adapted for laboratory and machine shop use in the early 1960s, and converted to its present use as an administrative office in the early 1980s. The area around Building 321 is paved on the southeast side, with two abandoned railroad tracks running along the side of the building. The rail line closer to the building was most likely a loading and unloading area for the building because there is an old stone and concrete loading dock under the wooden porch on this side of the building. GPB is located approximately 300 ft east of the building through wooded wetlands.

There are currently no plans for future construction at PICA-108 (210)/Site 210.

The layout of PICA-108 (210)/Site 210 is shown on Figure 3-46.

### 3.23.2 Previous Investigations

Four environmental investigations were conducted at PICA-108 Site 210: Dames and Moore conducted a Preliminary Assessment in 1994, USACHPPM conducted a Relative Risk Site Evaluation (RRSE) in 1998, sewer excavation was carried out in 1998, and environmental sampling was conducted at Building 321 during the 2000 Phase I 2A/3A RI.

An exterior and interior survey of Building 321 was conducted in October 1994. The porch floor boards near one of the former loading docks on the west side of the building were stained, and the origin of the staining was most likely the result of spills occurring near the door area. Two surface soil samples were collected under the 20 ft long by 6 ft wide oil stain on the porch along the northwest side of the building. The samples were analyzed for metals, SVOCs, PCBs, pesticides, and explosives.

Based on the limited volume of contaminated soil, an interim removal action was performed at Site 210 in November 2003 as part of the Facility-Wide Sump and Dry Well Investigation. An area approximately 36 ft by 9 ft by 2 ft (24 cubic yards) was excavated beneath the stained floorboards back to the building's foundation. Post-excavation sampling contained no SC exceedances, and the site was proposed for closure with no further action.

Two soil borings were installed at Site 210 to evaluate potential contamination associated with sewer line breaks and leaks that may have occurred at the site. The soil borings were installed on each side of the sewer line southeast of Building 321, and two subsurface samples were collected from each soil boring. As part of the sanitary sewer system renovations/replacement project, soil samples were obtained at suspected areas of contamination as observed during excavation. In addition to samples from the sewer line trench, soil piles staged from the excavation were sampled.

The 2000 Phase I 2A/3A RI included the collection of seven surface soil and four subsurface soil samples.

### 3.23.3 Nature and Extent of Contamination

Sample locations where the SC were exceeded are shown on Figure 3-47, and the analytical data available in the Picatinny database are included in Appendix A.

The only SC exceedances at Site 210 were observed in one surface soil sample (G-B321-SS-5). The two SC exceedances at this sample location were benzo(a)pyrene (SC = 0.2 mg/kg) with a concentration of 0.45 mg/kg and arsenic (SC = 19 mg/kg) with a concentration of 20.3 mg/kg. This sample location is located on the southeast side of Building 321. The area surrounding Building 321 is paved, and the slight exceedance of the current benzo(a)pyrene SC is most likely due to asphalt paving. The slight arsenic exceedance is due to the naturally occurring arsenic in this area.

#### 3.23.4 Summary of Risk Assessments

##### 3.23.4.1 Human Health

An HHRA was completed in 2005 for PICA-108/210 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at PICA-108/210 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 2E-05/ noncarcinogenic HI of <1.
- Future Construction Excavation Worker: carcinogenic risk number of 4E-07/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Future Adult Resident (soil): carcinogenic risk number of 7E-05/ noncarcinogenic HI of <1.
- Future Child Resident (soil): carcinogenic risk number of 1E-05/ noncarcinogenic HI of 2.

#### 3.23.4.2 *Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.23.4.3 *Ecological*

According to the 2005 Screening Level ERA (SLERA), no ERA is required for PICA-108/210 due to the lack of suitable habitat and the small size of the site. The highly-urbanized nature of the site would dissuade most species, even those adapted to urban areas. Although a potential risk to wildlife could exist if there was sufficient exposure to contaminants, the fact that the majority of the site is mainly paved and surrounded on three sides by roads limits the potential for exposure.

#### 3.23.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are not a concern because of its limited ecological habitat.

For hypothetical residential use risk scenarios, risks are within the generally acceptable risk range of 1E-06 to 1E-04; however, the HI is greater than 1 for the Child Resident scenario.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.24 PICA-122/Site 126—Building 197, Propellant Testing**

#### 3.24.1 Site History

PICA-122/Site 126 consists of Building 197, a one-story 48 ft by 55 ft structure with brick walls and a concrete foundation. It was constructed in 1942 and is used for propellant testing. The propellant testing is conducted in a conditioning chamber inside the building. Approximately five pounds of propellant waste is generated per month from testing operations. The propellant waste is placed in red cans for disposal at the Picatinny Burning Ground. The layout of Site 126 is shown on Figure 3-48.

There are currently no plans for future construction at PICA-122/Site 126.

#### 3.24.2 Previous Investigations

In 1995, four soil samples were collected during the Phase I RI, and analyzed for VOCs, SVOCs, explosives, metals, and cyanide. The sample collected near transformer pad TR-166 was also analyzed for pesticides and PCBs.

The Phase I 2A/3A RI included the collection of 1 subsurface soil and 13 surface soil samples from September 2000 through October 2001. From October 2003 until May 2004 the northeast portion of Site 126 was further delineated by collecting 29 additional surface soil samples.

#### 3.24.3 Nature and Extent of Contamination

Sample locations where the SC were exceeded are shown on Figure 3-49, and the analytical data available from the Picatinny database are included in Appendix A.

In surface soils, one pesticide, dieldrin, exceeded the SC (0.2 mg/kg) at F-SS126-3 with concentrations of 0.25 mg/kg for LH17 and non-detect for LM25. This slight exceedance is likely the result of some pesticide usage for insect population control. Cadmium was detected at concentrations greater than the SC (78 mg/kg) in twenty surface soil samples. The concentrations of cadmium ranged from 81.4 mg/kg at sample location F-126-SS-016 to 1980 D mg/kg at sample location F-126-SS-025. Cadmium is used in propellant manufacturing as a stabilizer, and Building 197 is still an active manufacturer of propellant. There was one arsenic exceedance of the SC value (19 mg/kg) at F-SS126-1 (29.7 mg/kg) and one chromium exceedance of the SC value (200 mg/kg) at F-SS126-2 (2200 D mg/kg). No other constituents exceeded SC.

### 3.24.4 Summary of Risk Assessments

#### 3.24.4.1 Human Health

An HHRA was completed in the Dames and Moore Phase I Report and revised in 2005 for Site 126 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 126 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 9E-06/ noncarcinogenic HI of <1.
- Future Outdoor Maintenance Worker : carcinogenic risk number of 6E-07/noncarcinogenic HI of <1.
- Future Construction Worker: carcinogenic risk number of 2E-05/ noncarcinogenic HI of 2. However, while the total hazard index for all target endpoints or effects combined is 2, after segregating the estimated target indices for each compound by common target organ or effect in accordance with USEPA guidance (USEPA 1989), the hazard index for each target organ/effect is less than or equal to one, which indicates that adverse noncancer effects are not expected to occur. The HI for each target organ/effect is less than or equal to 1, which indicates that adverse noncancer effects are not expected.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.24.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.24.4.3 Ecological

A site-specific ERA was conducted at Site 126 as part of the Phase I ERA for Sites 60, 61, 104, and 124. The habitat of the northern part of the Assessment Area (Sites 124

and 126) is likely to be highly usable for several species. Neither the small mammal studies nor the earthworm bioassays, however, found any substantive impacts in these areas. Data from the small mammal bioaccumulation study indicates limited COPC bioaccumulation. Based on these results, ecological impacts are expected to be minimal.

Cadmium concentrations exceed the ecological LOC and could create a calculated but localized ecological risk to a small number of individual organisms; however, toxicity testing and small mammal tissue analysis conducted across the larger study area indicate that there is no unacceptable ecological risk to the overall population. Therefore, a remedial action is not necessary to address these potential ecological risks posed by localized elevated cadmium concentrations.

#### *3.24.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range for the industrial/research worker and construction worker of 1E-06 to 1E-04;
- The noncarcinogenic hazard is <1 for the industrial/research worker and 2 for the construction worker, but less than 1 by endpoint;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are not a concern because there are no substantive impacts.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.25 PICA-134/Site 30—Building 3045, Fluorochemical Storage**

#### 3.25.1 Site History

PICA-134/Site 30 consists of Building 3045 and is located in the eastern portion of Area I along West Tower Road. Building 3045 is an earth-covered concrete structure constructed in 1918 as a magazine for storage of ammunition and gas cylinders. According to the RI Concept Plan (ANL 1991), Building 3045 was used to store rocket propellant fuels in the 1960s. File documents dated January 1982 reported that cylinders containing trifluorodibromine, chlorine trifluoride, and other fluorochemicals were stored temporarily at Building 3045, and these materials were observed in the building during a 1982 cleanup inventory (Shaw 2005c). Since its RCRA closure in 1991, the building is reportedly inactive. The location of Site 30 is shown on Figure 3-50.

There are currently no plans for future construction at PICA-134/Site 30.

#### 3.25.2 Previous Investigations

Two environmental investigations were conducted at PICA-134/Site 30, including the RCRA closure activities in 1991, and a Phase II RI Report, where two rounds of soil sampling were conducted in December 1995 through June 1996 and in May 2001 through February 2002.

As part of the 1991 RCRA closure, the floors, walls, and surfaces were pressure washed, rinsed, and dried prior to collecting wipe, chip, and rinsate samples for clean closure verification. Following the 1991 closure, the building has reportedly been inactive.

The initial 1995 Phase II RI sampling program included collection of eight surface soil and eleven subsurface soil samples to evaluate the potential impacts to site soil due to historical fluorochemical and propellant storage in Building 3045. During this first round of field investigation and sampling, on-site analysis was performed on all surface soil and subsurface soil samples, while off-site analysis was conducted only on four surface soil samples and three subsurface soil samples. The on-site samples were analyzed for VOCs, SVOCs, explosives, pesticides/PCBs, and TPH, while off-site analyses included VOCs, SVOCs, metals, ammonia, fluoride, and total phosphates, and, for some samples, ethylene oxide, and hydrazine.

During the second round of RI soil sampling, conducted in 2001 and 2002, five surface soil samples were collected and analyzed off-site for SVOCs and arsenic.

### 3.25.3 Nature and Extent of Contamination

Data available in the Picatinny data base are included in Appendix A. Figure 3-51 shows the locations and concentrations where one or more constituents exceeded an SC.

Five PAHs and one metal (arsenic) were the only constituents detected at concentrations greater than the SC in surface soil samples. Benzo(a)pyrene concentrations exceeded the SC = 0.2 mg/kg in samples: I-30-SS-001A (20 mg/kg), I-30-SS-004 (8.4 D mg/kg), I-30-SS-005 (3.1 D mg/kg), I-30-SS-006 (5.3 D mg/kg), I-30-SS-007 (0.55 mg/kg), and I-30-SS-008 (0.38 mg/kg). Benz(a)anthracene concentrations exceeded the SC = 2 mg/kg in surface soil samples: I-30-SS-001A (20 mg/kg), I-30-SS-004 (7.2 D mg/kg), I-30-SS-005 (2.7 D mg/kg), and I-30-SS-006 (4.5 D mg/kg). Benzo(b)fluoranthene concentrations exceeded the SC = 2 mg/kg in surface soil samples I-30-SS-001A (20 mg/kg), I-30-SS-004 (9.7 D mg/kg), I-30-SS-005 (3.7 D mg/kg), and I-30-SS-006 (6.4 D mg/kg). Dibenz(a,h)anthracene concentrations exceeded the SC = 0.2 mg/kg in surface soil samples I-30-SS-004 (0.99 D mg/kg), I-30-SS-005 (0.48 JD mg/kg), and I-30-SS-006 (0.92 JD mg/kg). Indeno(1,2,3-cd)pyrene concentrations exceeded the SC = 2 mg/kg in surface soil samples I-30-SS-001A (9 mg/kg), I-30-SS-004 (3.5 D mg/kg), and I-30-SS-006 (2.9 D mg/kg).

Arsenic concentrations in surface soil exceeded the SC = 19 mg/kg in four of six surface soil samples, including I-30-SS-001A (130 mg/kg), I-30-SS-004 (23.1 J mg/kg), I-30-SS-005 (23.1 J mg/kg), and I-30-SS-008 (33.2 J mg/kg).

Only one subsurface soil sample contained constituents that exceeded SC. Soil boring I-30-SB-001A had concentrations of benzo(a)pyrene (1.1 mg/kg) and dibenz(a,h)anthracene (0.27 mg/kg) that were greater than their respective SC in the sample collected from the 5-7 ft bgs interval; however, SVOCs were not detected in the surface soil at this location. Samples collected from deeper intervals at this location did not contain SVOCs at concentrations greater than the SC. No other constituents were detected in subsurface soils in concentrations that exceeded SC.

### 3.25.4 Summary of Risk Assessments

#### 3.25.4.1 Human Health

An HHRA was completed in the 2007 for Site 30 receptors and provided previously in the Phase II RI Report (2005c). The carcinogenic risk for the reasonably anticipated future use of industrial /research worker was reassessed in 2009 and updated to include currently accepted parameters as detailed in Appendix C. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 30 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker: carcinogenic risk number of 8E-05/  
noncarcinogenic HI of <1.
- Future Construction Excavation Worker: carcinogenic risk number of 9E-07/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.25.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.25.4.3 Ecological

Because the area around Building 3045 is forested, Site 30 was evaluated in the Phase II ERA. Soil samples collected at the site during the Round I investigation were evaluated during the ERA to determine the potential ecological risk to terrestrial species using the site. Results of the food chain modeling indicate the potential risk to terrestrial wildlife is minimal. EEQs for the COPECs were less than 1 for all chemicals with the exception of arsenic, a naturally occurring metal, in the white-footed mouse.

#### 3.25.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site as it is not a COPC; and
- Ecological risks are minimal based on food chain modeling.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.26 PICA-134/Site 70—Buildings 3028 and 3029, Research and Development Laboratory and Chemical Storage Area**

#### 3.26.1 Site History

PICA-134/Site 70 is located on the southeast side of Area I approximately 650 ft from the shore of Picatinny Lake. Site 70 consists of Building 3028 (a research and development laboratory), Building 3029 (a general purpose warehouse), and a pad-mounted transformer (TR-3028) associated with the buildings. Building 3028 is connected to Building 3029 by a two-story annex. The layout of Site 70 is shown on Figure 3-52. Building 3028 is a two-story masonry structure that was operated by the Navy as a supply storehouse until the 1950s and as a warehouse for artillery equipment until 1980. Between 1980 and 1982, the building was renovated to be used as laboratories and offices. Use of the research and development laboratories began in 1982, and the last known use was as an explosive chemistry laboratory.

Research activities at Building 3028 generated waste streams that include solvents, nitrocellulose, Explosive A in solvents, Explosive B in water, propellant material,

ethanol, tetrahydrofuran, methyl alcohol, ethyl acetate, and ether. Dye testing conducted in 1991 indicated that five laboratory sinks discharged to an acid neutralization tank located on the east side of the building, which then discharged to the sanitary sewer system. The acid neutralization tank has reportedly been removed. Mercury remediation was conducted in one of the building's laboratories after mercury vapor was observed during air sampling in 1990. Small amounts of mercury may have discharged to sink and floor drains following cleanup of spills that occurred during routine laboratory activities. Bottles of unused radioactive material were found in the building during a radiation inspection. Building 3028 also contained an explosive detector with a sealed nickel-63 source. In the past, the laboratory periodically worked with thorium solutions and uranium compounds. According to Picatinny personnel, all radioactive materials have been removed from the building (Shaw 2005c).

Building 3029 was connected to the north end of Building 3028 and operated as an unofficial warehouse for storage of chemicals and equipment used in Building 3028 operations. Unopened chemicals, including flammables, solvents, alcohols, acetone, acetic acid, sodium hydroxide, cadmium sorbate, sulfuric acid, and nitric acid with crystallized TNT, were stored in steel cabinets in the building and on the outside deck. The building was demolished, and a 1,000-square-foot surveillance facility was constructed in its place.

One 1,500-KVA pad-mounted transformer (TR-3028) was replaced in the 1990s as part of a facility-wide removal replacement action for transformers.

The Picatinny Master Plan (long range) includes the construction of an additional building to house an "Energetic Materials Chemistry Complex" adjacent to Building 3028.

### 3.26.2 Previous Investigations

In addition to the mercury investigation, dye testing for sinks and floor drains, and the radiological inspections conducted inside the buildings, two environmental investigations were conducted at Site 70, including the RCRA closure activities conducted in 1991 and the Phase II RIs conducted from June 1995 to October 1996 and May to June 2001.

During the RCRA closure of Buildings 3028 and 3029, remaining debris and/or waste was removed, floors and walls were pressure washed and rinsed, and rinsate and chip samples were collected for closure verification. The analytical results of chip and

rinsate samples detected some closure parameters above method detection limits for some heavy metals. However, documentation from NJDEP dated December 1992 asserts that the closure areas did not require further action (Shaw 2005c).

The initial 1995 Phase II RI included a radiological survey, the installation of two monitoring wells (I-70MW-001 and I-70MW-002), and collection of eight surface soil samples, nine subsurface soil samples, and two groundwater samples. The 2001 follow-up investigation included collection of one groundwater and one surface soil sample. Four of the surface soil samples (I-70-SS-001A, I-70-SS-002C, I-70-SS-003C, and I-70MW-002A) and two of the sub-surface soil samples (I-70MW-001E and I-70MW-002D) were collected for off-site analysis of VOCs, SVOCs, metals, anions, radiologicals, and explosives. Surface soil sample I-70-SS-004A was collected for off-site analysis of SVOCs and PCBs. The remaining soil samples were analyzed onsite; on-site sample analytical data are not discussed herein. During the initial Phase II RI, groundwater samples were collected and analyzed offsite for VOCs, SVOCs, metals, anions, radiologicals, and explosives. Only lead was analyzed when monitoring well I-70MW-001 was sampled during the second round.

### 3.26.3 Nature and Extent of Contamination

The analytical data available from the Picatinny database are included in Appendix A. Figure 3-53 shows the locations and concentrations where one or more constituent exceeded an SC.

One SVOC, benzo(a)pyrene, was detected in surface soil sample I-70-SS-002C at a concentration of 0.41 mg/kg, which is greater than the SC for benzo(a)pyrene of 0.2 mg/kg. No other constituents were detected at concentrations exceeding SC.

### 3.26.4 Summary of Risk Assessments

#### 3.26.4.1 Human Health

An HHRA was completed in 2005 for Site 70 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of  $1E-06$  to  $1E-04$ . Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 70 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Future Industrial Research Worker (chemical risks): carcinogenic risk number of  $2E-05$ / noncarcinogenic HI of  $<1$ .
- Future Construction Excavation Worker (chemical risks): carcinogenic risk number of  $8E-08$ / noncarcinogenic HI of  $1$ .
- Future Industrial Research Worker (radiological risks): carcinogenic risk number of  $4E-06$ .
- Future Construction Excavation Worker (radiological risks): carcinogenic risk number of  $5E-06$ .

No additional human health risks were calculated for hypothetical use scenarios.

#### *3.26.4.2 Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### *3.26.4.3 Ecological*

Site 70 was not evaluated in the Phase II ERA, because of limited available habitat consisting primarily of mowed lawns. The soil samples representing the site were collected adjacent to the building, parking lot or on a hillside of rubble. The lack of suitable habitat on-site limits the potential for exposure and associated risks are expected to be minimal.

#### *3.26.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range for the industrial/research worker and less than the range for the construction worker of  $1E-06$  to  $1E-04$ ;
- The noncarcinogenic hazard is at or less than the threshold of  $1$ ;

- Lead is not a concern at this site as it is not a COPC; and
- Ecological risk is not a concern due to limited habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.27 PICA-134/Site 83 - Physical Analysis Laboratory for Energetics**

#### 3.27.1 Site History

PICA-134/Site 83 is located along the unnamed ridge that trends along the southeast side of the installation and consists of Building 3022 and seven pad-mounted transformers located on the western side of the building. The layout of Site 83 is shown on Figure 3-54. Building 3022, an old Naval Powder Depot, is the product of a 1981 renovation that joined Buildings 3021 and 3022. The east wing of Building 3022 also adjoins Building 3024. The majority of the building is currently a laboratory where chemistry and physics research is conducted for energetics development and testing.

The north wing of Building 3022 (formerly Building 3021) is currently used to store radioactive source materials. According to the RI Concept Plan, materials stored or used in the laboratory back in 1990 include several hundred curies (Ci) of tritium, more than 10,000 Ci of cobalt-60, several hundred pounds of uranium-238, curie amounts of cesium-137, californium-252 and plutonium-238, and smaller amounts of other undocumented radioactive materials. Bottles of unused radioactive material were found in laboratory storage cabinets during a radiation inspection, though no radiation contamination was evident during a building survey conducted after the discovery. Dye testing conducted in 1991 indicated that one sink and one floor drain in Room 40 discharged to the acid tank outside the building (to the northwest of TR-3022), which was subsequently approved for closure in place by NJDEP in 1995. In 1991, a RCRA closure was performed at Building 3022 that included removing waste material from the first-floor laboratories.

A wide variety of chemicals in relatively small quantities are used and stored in Building 3022, including PCBs, methylpentane, nitromethane, nitric acid, hydrochloric acid, butyl

nitrite, sulfuric acid, and nitrogen dioxide. Waste chemicals and acids are red-canned and sent to the Picatinny Burning Ground for disposal. However, according to Picatinny personnel, small quantities of chemicals and waste may have been poured down sink drains in the past (Shaw 2005c).

Three 25-KVA and three 100-KVA pad-mounted transformers (TR-3021) were located on the western side of Building 3022, and one 1,500-KVA transformer (TR-3022) was located in the courtyard of the building. According to the Picatinny transformer database, none of these seven transformers contained PCBs. The transformers were replaced with new transformers in the 1990s as part of a facility-wide transformer replacement/removal action.

There are currently no plans for future construction at PICA-134/Site 83.

#### 3.27.2 Previous Investigations

In addition to the radiological inspection and survey conducted inside the laboratory and the dye testing for sinks and floor drains, two environmental investigations were conducted at Site 83, including RCRA closure activities conducted in 1991, and the Phase II RI conducted from June 1995 and May 1996 and April and May 2001.

During the RCRA closure of Building 3022, the walls of Room E and the floors of each designated closure area were washed and damp mopped, and wipe and rinsate samples were collected for closure verification. The analytical results of wipe and rinsate samples detected some closure parameters above method detection limits for some heavy metals. However, documentation from NJDEP dated December 1992 asserts that the closure areas did not require further action (Shaw 2005c).

The initial Phase II RI was conducted between June 1995 and May 1996. The RI included a radiological survey and collection of 19 surface soil and 23 subsurface soil samples. The follow-up investigation was conducted between April and May 2001 included the collection of six surface soil samples. Two of the surface soil samples (I-83-SS-006A and I-83-SB-001A) and two of the sub-surface soil samples (I-83-SB-001B and I-83-SB-001C) were collected for offsite analysis of VOCs, SVOCs, metals, anions, radiologicals, fuel and explosives. Surface soil sample I-83-SS-006A was also analyzed offsite for PCBs. Surface soil samples I-83-SS-001A, I-83-SS-002C, I-83-SS-003C, I-83-SB-003A, and I-83-SB-004A and sub-surface soil samples I-83-SB-002A, I-83-SB-002C, I-83-SB-003B, and I-83-SS-4B were analyzed offsite for metals, anions, radiologicals, and explosives. Surface soil samples I-83-SS-004B and I-83-SS-005B

were analyzed offsite for PCBs, and surface soil samples I-83-SS-007A, -008A, -009B, -010A, -011A, and -012A were analyzed offsite for lead. The remaining soil samples were analyzed onsite; onsite sample analytical data are not discussed herein.

### 3.27.3 Nature and Extent of Contamination

The analytical data available in the Picatinny database are included in Appendix A. Figure 3-55 shows the location and concentration one or more constituent exceeded an SC.

One constituent, arsenic was detected in surface soil sample I-83-SS-006A at a concentration of 22 mg/kg, which is greater than the SC of 19 mg/kg. The radiological survey conducted in 1995 did not indicate concentrations of radiological compounds greater than background values given in the PTA Background Study Report in either surface or sub-surface soil at Site 83. No radiological compounds were detected at concentrations greater than SC, though most such compounds do not have an SC value.

### 3.27.4 Summary of Risk Assessments

#### 3.27.4.1 Human Health

An HHRA was completed in 2005 for Site 83 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 83 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 2E-05/  
noncarcinogenic HI of <1.
- Construction Excavation Worker: carcinogenic risk number of 3E-06/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.27.4.2 *Lead Blood Model Result*

The current and reasonably anticipated future use scenarios were reevaluated at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 165 mg/kg, less than the calculated PRG of 1,092 mg/kg.
- Current Construction Worker (subsurface soil): No concern - average lead concentration of 118 mg/kg, less than the calculated PRG of 1,092 mg/kg.

#### 3.27.4.3 *Ecological*

Site 83 consists of Building 3022, pavement and mowed areas. There is little cover for terrestrial species at Site 83, thus food chain effects are unlikely. As a result, Site 83 was not evaluated in the Phase II ERA.

#### 3.27.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern, as the average concentration is less than the calculated PRG; and
- Ecological risk is not a concern due to limited habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.28 PICA-135/Site 71 – Building 910, General Purpose Laboratory**

#### 3.28.1 Site History

PICA-135/Site 71 consists of Building 910, located on Fidler Road along the northwestern shore of Picatinny Lake (Figure 3-56). The small site (0.2 acre) is situated on an alluvial delta that extends into the lake. Building 910 is a one-story structure that was constructed in 1950 as a storage magazine. Building 910 was utilized until the 1970s for the environmental testing of munitions to determine the effect of temperature and humidity on propellants and explosives. In 1991, closure activities were performed on Building 910 by washing down the walls and walk-in areas and removing any remaining debris.

There are currently no plans for future construction at PICA-135/Site 71.

#### 3.28.2 Previous Investigations

Three previous studies have been conducted at Site 71. These activities included closure activities performed in 1991, an initial Phase II RI sampling program conducted between May 1996 and August 1996, and follow-up investigations conducted between April 2001 and February 2001.

Closure activities were performed on Building 910 by washing down walls and walk-in areas and removing any remaining debris. Chip samples collected at Building 910 after the cleaning process indicated the presence of arsenic, beryllium, cadmium, chromium, copper, lead, nickel, and zinc. Closure of Building 910 was performed in accordance with the approved closure plan, and according to correspondence from Thomas Sherman, NJDEP, to Thomas Solecki, ARDEC, dated December 1992, the closure area did not require further action.

The initial Phase II RI (Round 1) was conducted between May 1996 and August 1996. Sampling activities consisted of collecting one surface water sample, one sediment sample, and six surface soil and six subsurface soil samples, collected at three locations. During the Round I field investigation, on-site analysis was also performed on all surface soil, subsurface soil and sediment samples. These samples were analyzed for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPHs.

Phase II Round 2 RI investigations included the collection of eight surface soil and two subsurface soil samples. These activities were conducted between April 2001 and February 2002. These samples were analyzed for SVOCs and arsenic.

### 3.28.3 Nature and Extent of Contamination

Areas where SC are exceeded are shown on Figure 3-57. Data available in the Picatinny database are presented in Appendix A.

Seven surface soil samples at Site 71 contained at least one of four SVOCs at concentrations greater than the SC, and five surface soil samples had detections of arsenic at concentrations greater than the SC. The maximum concentrations of all four SVOCs were at location I-71-SS-002A, 0-1 ft bgs (three of the maximum concentrations were in the duplicate sample from this location); 3 mg/kg benz(a)anthracene (SC = 2 mg/kg), 4 mg/kg benzo(a)pyrene (SC = 0.2 mg/kg), 4 mg/kg benzo(b)fluoranthene (SC = 2 mg/kg), and 0.5 mg/kg dibenz(a,h)anthracene (SC = 0.2 mg/kg). The maximum concentration of 40 mg/kg arsenic (SC = 19 mg/kg) was detected in a sample from location I-71-SS-001A, 0-1 ft bgs.

In sediment sampling, location I-71-SD-001 had a detection of strontium greater than the SC value of 16 mg/kg. The concentration of strontium at this sampling location was 21.2 mg/kg at 0-1 ft bgs.

### 3.28.4 Summary of Risk Assessments

#### 3.28.4.1 Human Health

An HHRA was completed in 2005 for Site 71 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 71 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Industrial Research Worker: carcinogenic risk number of 8E-05/ noncarcinogenic HI of <1.

- Construction Excavation Worker: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.28.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.28.4.3 Ecological

Site 71 was not evaluated in the Phase II ERA because there is limited exposure potential for receptors, and the small size of the site makes it unlikely to elicit food chain effects. The surface water sample and the sediment sample were evaluated as part of Picatinny Lake (Site 53).

#### 3.28.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern as it is not a COPC; and
- Ecological risk is not a concern due to limited exposure potential for receptors.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.29 PICA-135/Site 82 – Building 908, X-ray Photoprocessing Laboratory**

#### 3.29.1 Site History

Site 82 consists of Building 908 and is located in the northern portion of Area I. Layout of Site 82 is shown on Figure 3-58. Building 908 was constructed in 1918 for use as a general purpose magazine. In 1945, a request was made to equip Building 908 with a radiographic inspection laboratory that would x-ray large allowances of loaded shells for manufacturing defects. A 20-million electron volt betatron x-ray unit with a 42-inch-thick protective concrete shield was installed. By 1964, a 25-million electron volt betatron x-ray unit and 1,000-kiloelectron volt (KeV), 250-KeV, and 200-KeV x-ray units were in operation as well as a 140-KeV fluoroscope.

A Californium Flux Multiplier has been housed in Building 908 since the early 1970s. This instrument has been used for experiments in neutron radiography, activation analysis, and neutron gauging. The source was relocated to the Building 908 addition upon its completion in the early 1980s. The californium neutron source utilized at Building 908 was 10.42 milligrams (mg) in 1971, but had dwindled to approximately 0.3 mg by 1984. The reduction in mass of the californium-252 was a result of radioactive decay. The source is sealed and reportedly no escape of this radioactive material has occurred. The emergency storage for the sealed source in the original Building 908 wing was a 2-inch-diameter hole cased by piping to a depth of 5 ft beneath the betatron unit. However, there is no record of this cavity ever being utilized. A gammatron-100 portable cobalt-60 radiographic source (sealed 100 Ci) was utilized in the existing and the expanded facility. A 300-kilovolt x-ray unit was relocated from its original placement in Building 908 to the addition in the early 1980s.

Building 908 has also housed an x-ray developing unit since 1945 and a silver recovery unit from 1963 to 1983. Spent developing fluid from the x-ray developing unit is currently mixed with process wash water and released to Picatinny's sanitary sewer. The spent fixer is collected, stored, and sent to Building 314 for silver reclamation. The overflow line from the spent fixer collection unit at Building 908 formerly discharged into Picatinny Lake. The discharge has been discontinued.

Throughout its operation, numerous documents have been produced outlining concerns for the high-energy gamma rays being produced by the betatron x-ray units at Building 908. During periods of operation, despite the protective barriers and increased shielding, high levels of radiation were recorded in the building.

Ten pad-mounted transformers (TR-980) were located near the southwest corner of Building 908. According to the Picatinny transformer database, the transformers ranged in size from 9.6-KVA to 75-KVA. The transformer database also indicated that five of the ten transformers were contaminated with PCBs at concentrations ranging from 5 to 361 mg/kg. In addition, the database indicated that two 23-KVA transformers were located inside of Building 908. These two transformers were not PCB contaminated. The transformers are still present and active. However, PCB-containing oil is no longer used.

There are currently plans for future construction of an Experimental Evaluation Facility, just northwest of Building 908 at PICA-135/Site 82.

### 3.29.2 Previous Investigations

Three investigations have been conducted at Site 82: the 1995 Outdoor Radiological Survey in 1995, Phase II RI, Round 1 from March to August 1996 and Phase II RI Round 2 from May 2001 and February 2002.

Prior to the 1996 RI, studies conducted at Building 908 were limited to radiation surveys during periods of operation. Elevated levels of radiation were recorded inside Building 908.

In 1995, radiological surveys were performed at Site 82 as part of the Site-Wide Outdoor Radiological Survey by SEG from June to July 1995. The 10-meter grids were established in survey areas around the buildings and four systematic samples were collected per grid with the exception of paved or restricted areas. A total of 119 samples were collected at Site 82 and analyzed for Gross Alpha, Gross Beta, and Gamma radiation.

As part of the Phase II RI Round 1 sampling activities, fourteen surface soil samples, ten subsurface soil samples from five locations, two surface water samples, and two sediment samples were collected. Round 1 sampling analyses were performed offsite and onsite. Off-site analysis included VOCs, metals, cyanide, anions, radiological parameters, and explosives for the five soil samples, the two surface water samples, and the two sediment samples. TOC was also analyzed offsite for the sediment samples. On-site analysis consisted of VOCs, SVOCs, explosives, pesticides, and PCBs for ten of the soil samples, subsurface soil samples, and sediment samples; only PCBs were analyzed in the remaining four soil samples. No surface water was analyzed onsite.

Follow-up investigations (Round 2) were conducted between May 2001 and February 2002 based on the results of the Round 1 sampling and regulatory comments. Round 2 sampling consisted of collection of five surface soil samples, one subsurface soil sample, and one sediment sample.

### 3.29.3 Nature and Extent of Contamination

Figure 3-59 shows the locations of samples where constituent concentrations exceeded SC. Data available in the Picatinny database are presented in Appendix A.

Five surface soil samples had concentrations of arsenic (SC = 19 mg/kg) greater than the SC. Concentrations of arsenic greater than the SC in surface soil ranged from 22.1 mg/kg (I-82-SS-005A, 0-1 ft bgs) to 58 mg/kg (I-82-SS-006A, 0-1 ft bgs). A concentration of 33 D mg/kg arsenic was detected in one subsurface soil sample, from sample location I-82-SS-006, 2-3 ft bgs. No other constituents were detected at concentrations greater than the SC in either surface or subsurface soils.

In sediment, concentrations of 0.66 mg/kg mercury (SC = 0.249 mg/kg), 26 mg/kg silver (SC = 1 mg/kg), and 25.4 mg/kg strontium (SC = 16) were detected in the sample I-82-SD-001. Constituents detected at concentrations greater than the SC in sediment sample I-82-SD-002 were: 1.83 mg/kg cadmium (SC = 1.7 mg/kg), 57.4 mg/kg lead (SC = 38.8 mg/kg), 0.26 mg/kg mercury (0.249 mg/kg), 1100 mg/kg silver (SC = 1 mg/kg), 110 mg/kg strontium (SC = 16 mg/kg), and 249 mg/kg zinc (SC = 171 mg/kg). No other constituents were detected at concentrations greater than the SC in sediments at Site 82.

In surface water, one VOC, 4.6 ug/L methylene chloride (SC = 2.5 ug/L), was detected in sample I-82-SW-001. One metal, 16.2 ug/L silver (SC = 3.8 ug/L), was detected in surface water sample I-82-SW-002 in August 1996. No other constituents were detected at concentrations greater than the SC in surface water samples at Site 82.

Sediment and surface water at Site 82 has been addressed in the Lakes FS (PICA-015, 057, and 195 FS [ARCADIS 2009a]).

### 3.29.4 Summary of Risk Assessments

#### 3.29.4.1 Human Health

An HHRA was completed as part of the Phase II RI Report (2005). The radiological carcinogenic risk for future Industrial/ Research Workers is  $5E-04$ , which exceeds USEPA's target risk range of  $1E-04$  to  $1E-06$  with radium-226, thorium-228, and radium-228 being the primary radiological risk drivers; however, the radiological data for Site 82 does not exceed the NJDEP cleanup goal for these isotopes ( $5 \text{ pCi/g}$ ) and no further action is required. The chemical and radiological cancer risks have not been added together as USEPA (1989) stipulates that they should not be considered to be additive.

With the exception of the isotopes listed above, the estimated reasonable maximum chemical exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of  $1E-06$  to  $1E-04$ . Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 82 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and Future Industrial/Research Worker: chemical carcinogenic risk of  $5E-05$ / noncarcinogenic HI of  $<1$ .
- Current and Future Construction/Excavation Worker: chemical carcinogenic risk of  $2E-06$ / noncarcinogenic HI of  $<1$ .
- Current and Future Industrial/Research Worker: radiological carcinogenic risk of  $5E-04$ ; however, as discussed above, the concentrations present are less than associated standards and no further action is required for these isotopes.
- Current and Future Construction/Excavation Worker: radiological carcinogenic risk of  $4E-05$ .

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.29.4.2 Lead Blood Model Results

Lead was not a COPC at this site and the Lead Blood Model was not evaluated.

#### 3.29.4.3 Ecological

As previously mentioned, sediment and surface water at Site 82 have been addressed in the "Lakes FS" (PICA-015, 057, and 195 FS [ARCADIS 2009a]). Site 82 was evaluated in the Phase II ERA (IT 2000 [PTA.T005.0008C]) due to the contiguous forested areas and the proximity of Picatinny Lake. A surface soil bioassay was conducted on one sample from the site (82SS-002), which did not exhibit any significant difference in mortality as compared to the control/reference samples.

#### 3.29.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic chemical risk is within the generally acceptable risk range of  $1E-06$  to  $1E-04$ ;
- The carcinogenic radiological risk is greater than the generally acceptable risk range of  $1E-06$  to  $1E-04$  for the current and future industrial/research worker for surface soil, but all concentrations of radiological parameters are less than the associated standard and no further action is required;
- The noncarcinogenic hazard is less than 1;
- Lead is not a concern as it is not a COPC; and
- Ecological risks are expected to be minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial), with the exception of radiological risk for the Current and Future Industrial/Research Worker; however, as discussed above, the concentrations present are less than associated standards ( $5pCi/g$ ), and no further action is required for these isotopes. Because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, however, this site cannot be released for unrestricted use.

### **3.30 PICA-135/Site 158 – Building 926, High-Explosive Magazine**

#### 3.30.1 Site History

PICA-135 (153)/Site 158 consists of Building 926, an earth covered, 12 ft by 12 ft structure, and is located along the northern shore of Picatinny Lake (Figure 3-60). Building 926 was built in 1922 as a high-explosive magazine. It has a single steel door and a lead-plated loading platform that extends into the lake. Building 926, referred to as the cave, was used to store lead azide, lead styphenate, and mercury fulminate until the mid-1960s. According to Picatinny documentation, all styphenates and azides were removed in the early 1980s. It is unknown where the explosives were disposed, but a 1983 SOP indicated that the explosives were detonated in the gorge area.

There are currently no plans for future construction at PICA-135 (153)/Site 158.

#### 3.30.2 Previous Investigations

The initial Phase II RI sampling activities (Round 1) at Site 158 were conducted between March 1996 and August 1996. The RI sampling program consisted of collecting two surface soil samples, one subsurface soil sample, two surface water samples, and two sediment samples. Sample I-158-SS-001A was sent for off-site analyses, including explosives and metals. During the sampling program, a radiological survey was conducted. During the Round 1 field investigation, on-site analysis was also performed on all surface soil, subsurface soil, and sediment samples, however, this data is not discussed herein. These samples were analyzed for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPHs. Follow-up investigations were conducted in May 2001 and May 2002, and consisted of collecting two sediment samples and three surface water samples.

#### 3.30.3 Nature and Extent of Contamination

Locations where SC were exceeded are shown on Figure 3-61. Data available in the Picatinny database are summarized in Appendix A.

There were no constituents detected in soil samples at concentrations greater than SC.

Nine metals were detected in sediment samples at concentrations greater than their respective SC. Maximum concentrations of 1100 mg/kg lead (SC = 38.8 mg/kg) and 28.2 D mg/kg mercury (SC = 0.249 mg/kg) were detected at sediment sample location

I-158-SD-001. The maximum concentration of strontium, 23.1 mg/kg (SC = 16 mg/kg), was detected at location I-158-SD-002. The maximum concentration of arsenic, 34.9 mg/kg (SC = 19 mg/kg), was detected at location I-158-SD-005. Maximum concentrations of 13.7 J mg/kg cadmium (SC = 1.7 mg/kg), 42.5 J mg/kg nickel (SC = 39.6 mg/kg), 22.1 J mg/kg silver (SC = 1 mg/kg), and 915 J mg/kg zinc (SC = 171 mg/kg) were detected at location I-158-SD-006. The maximum concentration of 364 J mg/kg copper (SC = 28 mg/kg) was detected in the duplicate sample from I-158-SD-006. No other constituents were detected in sediment samples at concentrations greater than SC.

In surface water samples, the only constituent detected with a concentration that exceeds the SC was 0.3 J ug/L cadmium (SC = 0.28 ug/L) from location I-158-SW-003; however, the duplicate sample from this location was non-detect for cadmium, and it did not contain any other constituents in concentrations greater than the SC.

Surface water and sediment are addressed in the PICA-057 FS (ARCADIS 2009a).

### 3.30.4 Summary of Risk Assessments

#### 3.30.4.1 Human Health

An HHRA was completed in 2005 for Site 158 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 158 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 4E-06/  
noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.30.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.30.4.3 Ecological

Site 158 is essentially a magazine, a loading dock, and a gravel road. Due to its small size (0.2 acre) and low habitat quality, surface soil was not evaluated in the Phase II ERA. Surface water and sediment results from Round I were evaluated as part of Picatinny Lake. A sediment bioassay of sample I 58SD-1 did not exhibit significant toxicity in the two test organisms. No significant perturbations were noted in the benthic macroinvertebrate survey conducted at Site 158. Metrics measured during the survey indicated conditions at Site 158 were better than the reference locations. Based on these data, ecological impacts are expected to be minimal.

#### 3.30.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern as it is not a COPC; and
- Ecological risk is not a concern due to limited exposure potential for receptors.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.31 PICA-135/Site 159 – Former Building 975, Supplies and Services Administration Building**

#### 3.31.1 Site History

PICA-135 (154)/Site 159 consists of Building 975, located along the shore of GPB, approximately 200 ft north of the northern shore of Picatinny Lake. The layout of Site

159 is shown on Figure 3-62. Building 975 was constructed in 1942. It was originally built as a bomb shelter, but was later utilized as the main office for the 800 building storage area. Building 975 was also used to store packed shells and explosives prior to shipment. In 1998, the building was demolished under TECUP.

A 1986 inventory indicated that RDX, Composition A, and Composition B were stored at Building 975. An additional inventory indicated that the M207 warhead, the Viper warhead, DU penetrators, and nine classified materials were also stored at Building 975. Picatinny engineering drawings indicated that a sump on the south side of Building 975 might have received water from building washdown activities. In interviews conducted by ANL in 1989, Picatinny personnel reported that lead azide was taken from Building 926 in 1983 and buried behind Building 975.

There are currently no plans for future construction at PICA-135 (154)/Site 159.

### 3.31.2 Previous Investigations

The initial Phase II RI sampling activities (Round 1) at Site 159 were conducted between May 1995 and November 1996. The RI included:

- Geophysical and radiological surveys;
- Collection of eight surface soil and four subsurface soil samples;
- Two surface water samples;
- One sump sample;
- Two sediment samples;
- One test pit excavation, and collection of two subsurface soil samples from the test pit;
- Installing one soil boring, and collection of two subsurface soil samples from this location;
- Installing one monitoring well, and collection of two subsurface soil samples from this location; and

- Collecting groundwater samples, performing aquifer testing, and surveying the newly installed well.

During the Round 1 field investigation, on-site analysis was also performed on all surface soil, subsurface soil, and sediment samples. These samples were analyzed for the following analytical parameters: VOCs, SVOCs, explosives, pesticides/PCBs, and TPHs.

Follow-up investigations (Round 2) were carried out between May and June 2001. During the Round 2 sampling program, one surface soil sample, one subsurface soil sample, and one sediment sample were collected.

### 3.31.3 Nature and Extent of Contamination

Areas where SC were exceeded are shown on Figure 3-63. Data available in the Picatinny database are presented in Appendix A.

No constituents were detected at concentrations greater than SC in surface or subsurface soil samples at Site 159.

In sediment samples, fifteen SVOCs were detected at concentrations greater than the SC. Maximum concentrations of all 15 SVOCs were detected in the sample collected at location I-159-SD-002: 0.11 mg/kg acenaphthene (SC = 0.00671 mg/kg), 0.15 mg/kg acenaphthylene (SC = 0.00587 mg/kg), 1.5 mg/kg anthracene (SC = 0.03162 mg/kg), 3 mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 2.9 mg/kg benzo(a)pyrene (SC = 0.0319 mg/kg), 4.5 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 1.3 mg/kg benzo(g,h,i)perylene (SC = 0.29 mg/kg), 2 mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 3.6 mg/kg chrysene (SC = 0.0571 mg/kg), 0.35 mg/kg dibenz(a,h)anthracene (SC = 0.00622 mg/kg), 7.9 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.94 mg/kg fluorene (SC = 0.0212 mg/kg), 1.7 mg/kg indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg), 5.3 mg/kg phenanthrene (SC = 0.0419 mg/kg), and 7 mg/kg pyrene (SC = 0.053 mg/kg). Two pesticides, 0.03 mg/kg 4,4'-DDE (SC = 0.00142 mg/kg) and 0.01 mg/kg 4,4'-DDT (SC = 0.00119 mg/kg), were detected in the sample from location I-159-SD-001. Four metals were also detected in the sediment samples. Cadmium (SC = 1.7 mg/kg) and copper (SC = 28 mg/kg) were detected at concentrations of 2.44 mg/kg and 151 mg/kg, respectively. Lead (SC = 38.8 mg/kg) was detected at a concentration of 72.9 mg/kg at location I-159-SD-001 and 56.4 mg/kg at location I-159-SD-002. Strontium (SC = 16 mg/kg) was detected at a concentration of 18.8 at I-159-SD-001.

In surface water, methylene chloride, a common laboratory contaminant, was detected in sample I-159-SW-002 at a concentration of 11 ug/L (SC = 2.5 ug/L). In the same sample, the following parameters were detected with concentrations greater than their respective SC: 2,4-DNT (SC = 0.11 ug/L) was detected at a concentration of 0.2 ug/L; aluminum (SC = 190 ug/L) was detected at a concentration of 295 ug/L; and lead (SC = 3.2 ug/L) was detected at a concentration of 4.79 ug/L. The only other surface water sample that exceeded the SC for lead was sample I-159-SW-001 with a concentration of 21.50 ug/L. The pesticide alpha-BHC (SC = 0.0026 ug/L) was detected at location I-SWBG-29 at a concentration of 0.45 N ug/L by USAEC UH20. The same sample was non-detect for Alpha-BHC by method USAEC UM25. No other constituents were detected in surface water at concentrations greater than the SC.

No constituents were detected in groundwater samples at concentrations greater than the SC at Site 159.

#### 3.31.4 Summary of Risk Assessments

##### 3.31.4.1 Human Health

An HHRA was completed in 2005 for Site 159 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 159 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and Future Industrial/Research Worker: carcinogenic risk number of 8E-06/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 8E-07/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Current and Future On-site Visitor: carcinogenic risk number of 6E-06/ noncarcinogenic HI of <1.

#### 3.31.4.2 *Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.31.4.3 *Ecological*

Site 159 is essentially a dirt field with no cover for animals. Despite the poor habitat, the site was evaluated in the Phase II ERA because the site is bordered by forested land and may revert to a more natural state. Two sediment bioassays performed in the upper portion of GPB exhibited significant toxicity. However, results of a benthic survey conducted in GPB adjacent to Site 159 indicated the habitat is equal to or better than the upgradient reference location. EEQs for the COPECs detected in soil samples collected at Site 159 suggested that there is little potential risk to small mammals, vermivorous birds and predatory birds from soil exposure. Also, EEQs for all COPECs were less than one with the exception of arsenic, a naturally occurring metal, in the white-footed mouse.

#### 3.31.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- Ecological risk is minimal due to poor habitat.

For the hypothetical On-site Youth Visitor risk scenario, risks are within the generally acceptable risk range of 1E-06 to 1E-04 and the HI is less than 1.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.32 PICA-136/Site 79 –Building 3013, High Pressure Boiler**

#### 3.32.1 Site History

PICA-136/Site 79 consists of Building 3013 and its associated pad-mounted transformers, is approximately 1.8 acres in size, and is located in Area I on South Office Road in the center of Picatinny. The location of Site 79 is shown on Figure 3-64. Built in 1901, Building 3013 was originally used as a main boiler house, but was last used as an auxiliary boiler house. Coal burners were used in the boilers to generate power until 1943 when they were replaced with oil burners. Former Building 3009, located southwest of Building 3013, was used for the bulk storage of coal for the boilers. Building 3013 was also used for explosives production during World War I and World War II and was expanded in the 1940s to include a water treatment system.

Two ASTs were installed at Building 3013 in 1943 when the facility changed the fuel supply from coal to oil. In 1967, the two ASTs were removed, and two 20,000-gallon USTs were installed for storage of fuel oil for the boiler. These USTs were in service until their removal in 1990. Discolored soil was observed and investigated after the tanks were removed. A temporary 2,000-gallon AST was installed for use until replacement oil tanks were installed. The temporary AST was removed following installation of two 2,000-gallon ASTs with secondary containment located to the southwest of Building 3013.

Historical activities in Building 3013 generated numerous waste materials, including waste oils, hydraulic fluid, boiler water sludge, and caustic soda. Explosive compounds that may have been used at Building 3013 include TNT, DNT, nitrocellulose, RDX, and HMX. Limited information is available regarding the handling and disposal of waste streams at the building. In 1991, a RCRA closure was performed that included removing waste material from the building.

One 15-KVA and two 25-KVA pad-mounted transformers were located on the east side of Building 3013 (TR-3013). All transformers were removed in the 1990s as part of a facility-wide transformer removal action.

There are currently no plans for future construction at PICA-136/Site 79.

### 3.32.2 Previous Investigations

In 1991 closure activities were conducted in order to remove any remaining waste materials and decontaminate the waste storage area in the southwestern most corner of Building 3013. Hydraulic oil generated from periodic maintenance in the building had been stored on pallets in this area (ICFKE 1998). As part of the 1991 closure activities, an asbestos survey was conducted. The survey did not detect asbestos-contaminated material in the closure area. Equipment was removed from the closure area, and the closure area walls were steam cleaned. Confirmatory samples collected indicated some closure parameters above method detection limits for heavy metals. However, documentation from NJDEP, dated December 1992, asserts that the closure areas did not require further action (Shaw 2005c).

During the 1992 Discharge Investigating and Correction Report (DICAR) investigation, two mounded 20,000-gallon fuel oil USTs were excavated. Approximately 1,500 tons of petroleum-impacted soil was removed from a 15-foot- deep excavation during the UST removal. Petroleum hydrocarbon concentrations reportedly ranged from 360 to 13,700 ppm in the seven soil samples collected from the excavation. Three monitoring wells were installed as part of the investigation. Samples collected from these wells were analyzed for VOCs, and SVOCs. VOCs and SVOCs were detected in each of the three wells. Further delineation of petroleum impacts was conducted during the 1994 Environmental Remedial Action Investigation, two monitoring wells were installed and analyses were conducted on groundwater collected from all five monitoring wells in the area. Soil samples were collected from nine sampling points. At the time, none of the compounds detected in groundwater exceeded the groundwater cleanup standards for Class II-A aquifers, and no further action was proposed. The data and sampling locations from this investigation were not available.

The initial Phase II RI sampling activities at Site 79 were conducted between March 1996 and October 1996 and included collection of eight surface soil, five subsurface soil and five groundwater samples. The follow-up investigation was conducted between April 2001 and February 2002 and involved collection of one groundwater sample, nine surface soil samples, and 12 subsurface soil samples. Groundwater samples I-79-MW-001, I-79-MW-002, I-79-MW15-101, I-79-MW15-102, and I-79-MW15-103; surface soil samples I-79-SS-001A, I-79-SB-001A, I-79SB-002A; and subsurface soil sample I-79-SB-001B were collected and analyzed for VOCs, SVOCs, metals, anions, fuel-related compounds, and explosives. Surface soil sample I-79-SS-002A was collected and analyzed for PCBs. Subsurface soil boring I-79-SB-002C was collected and analyzed for VOCs, SVOCs, fuel-related compounds, and explosives. During the follow-up

investigation, the groundwater sample collected from I-79-MW-001, surface soil samples I-79-SS-003A through -006A, and subsurface soil samples I-79-SS-003C through -006C were analyzed for lead. Surface soil samples I-79-SS-007A, I-79-SS-008A, I-79-SS-009, and I-79-SS-010 were analyzed for SVOCs. Surface soil sample I-79-SB-007A and subsurface soil samples I-79-SB-007B and -007C were analyzed for arsenic and radiological parameters. Subsurface soil samples I-79-SB-004B/004C, -005B/005C, and -006B/006C were analyzed for arsenic. Other samples were collected for on-site analyses; these data are not discussed herein.

### 3.32.3 Nature and Extent of Contamination

The analytical data available in the Picatinny data base are included in Appendix A. Figure 3-65 shows the locations and concentrations where one or more constituent exceeded an SC.

The SVOC benzo(a)pyrene was detected in surface soil samples I-79-SS-001A, I-79-SS-007, I-79-SS-008, I-79-SS-009, and I-79-SS-010A at concentrations greater than the SC (0.2 mg/kg), ranging in concentrations from 0.64 mg/kg to 12 mg/kg. Other SVOCs detected in these surface soil samples at concentrations greater than their respective SC (0.2 mg/kg to 2 mg/kg) include: benz(a)anthracene (SC = 2 mg/kg), at sample locations I-79-SS-001A (10 mg/kg), I-79-SS-008 (2.1 mg/kg), and I-79-SS-010A (4.1 D mg/kg); benzo(b)fluoranthene (SC = 2 mg/kg), at locations I-79-SS-001A (12 mg/kg), I-79-SS-008 (3.3 mg/kg), I-79-SS-009 (2.3 mg/kg), and I-79-SS-010A (6.9 D mg/kg); dibenz(a,h)anthracene (SC = 0.2 mg/kg), at locations I-79-SS-008 (0.39 mg/kg), I-79-SS-009 (0.44 mg/kg), and I-79-SS-010A (1.3 D mg/kg); and indeno(1,2-c,d)pyrene (SC = 2 D mg/kg) at location I-79-SS-010A (3.9 mg/kg). Lead (SC = 800 mg/kg) was detected in one surface soil sample, I-79-SB-002, at a concentration of 1,220 mg/kg. No other constituents were detected at concentrations greater than SC in Site 79 surface soil.

Arsenic (SC = 19 mg/kg) was the only constituent detected in subsurface soil at a concentration greater than the SC at I-79-SB-001 (110 mg/kg).

In groundwater sample I-MW-002, the VOCs bis(2-ethylhexyl)phthalate (SC = 3 ug/L) and methylene chloride (SC = 3 ug/L) were detected at concentrations of 6.7 ug/L and 4.6 ug/L, respectively. Both of these constituents are common laboratory contaminants. The naturally occurring metals iron (SC = 300 ug/L) and manganese (SC = 50 ug/L) were detected at concentrations greater than SC in groundwater samples I-MW15-101, I-MW15-102, I-MW15-103, and I-MW-001. Aluminum (SC = 200 ug/L) was also

detected at concentrations greater than the SC in groundwater samples I-MW15-101 (244 ug/L) and I-MW-001 (3,070 ug/L). Arsenic (SC = 3 ug/L) was detected at concentrations greater than the SC in samples I-MW15-101 (4.51 ug/L) and I-MW15-103 (3.29 ug/L). Lead (SC = 5 ug/L) was detected in two groundwater samples collected from I-MW-001 at concentrations greater than the SC (43.1 ug/L in 1996 and 15.3 ug/L in 2004). Lead was also detected in several groundwater samples from surrounding sites, at concentrations slightly greater than the SC. No other constituents were detected at concentrations greater than SC in Site 79 groundwater.

#### 3.32.4 Summary of Risk Assessments

##### 3.32.4.1 Human Health

An HHRA was completed in 2005 for Site 79 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 79 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Industrial Research Worker: carcinogenic risk number of 4E-05/ noncarcinogenic HI of <1.
- Construction/Excavation Worker: carcinogenic risk number of 5E-06/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

##### 3.32.4.2 Lead Blood Model Results

The current and reasonably anticipated future use scenarios were reevaluated at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 312 mg/kg, less than the calculated PRG of 1,092 mg/kg.

- Current Construction Worker (subsurface soil): No concern – lead not selected as COPC in this medium.

#### 3.32.4.3 Ecological

There is limited habitat at Site 79 because the site is predominantly Building 3013 and pavement. There is a small area of maintained lawn, which provides little cover for ecological receptors. Thus, Site 79 was not evaluated in the Phase II ERA.

#### 3.32.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- Ecological risk is minimal due to limited habitat.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### 3.33 PICA-162/Site 5 – Shell Burial Area near Building 3150

#### 3.33.1 Site History

PICA-162/Site 5 is located west of Building 3150 in the area of an explosion crater caused by the 1926 Lake Denmark explosion. Site 5 is presented on Figure 3-66. Exploded and UXO and most likely building debris from the explosion were deposited in the crater. The 1.5-acre area, under the control of the U.S. Naval Ammunition Depot, continued to be used as an ordnance-dumping area until 1945. The area was then

covered with approximately 20 ft of fill material, fenced, and marked with warning signs. Access to the 3150 burial area is limited. The area is also heavily vegetated, indicating the lack of recent intrusive activities.

During the 1996 site inspection, a slight depression was noted in the western section of the burial area. A mounded area was also noted in the northeastern section, although the site generally sloped to the northeast. Metal debris, including sheet metal and a drum lid, were located in a slightly depressed rocky area along the western perimeter. This debris does not appear to be associated with the original dumping. The rocks in this area appear to be placed, however, and there is no indication of their function. This site is currently inactive.

There are currently no plans for future construction at PICA-162/Site 5. Note that groundwater at this site is included under the Mid-Valley Groundwater action.

#### 3.33.2 Previous Investigations

One well (MW-3) was installed to a depth of 38.3 ft in 1981 as part of the Installations' groundwater monitoring program for known areas of potential contamination.

The 1989 Site Investigation (Dames and Moore 1989) consisted of installing two monitoring wells (DM5-1 and DM5-2) and collecting groundwater samples from all three site monitoring wells. The samples were analyzed for VOCs, components of solid propellants, metals, and explosives.

The first round of the Phase III-1A sampling at Site 5 was conducted between November 1998 and July 1999, and the second and third rounds were conducted between December 2000 and February 2001.

The Phase III-1A RI sampling program included installation of seven monitoring wells (5MW-4, 5MW-4D, 5MW-5, 5MW-6, 5MW-7, 5MW-8, and 5MW-9), collection of a total of 27 groundwater samples from the monitoring wells installed as part of this investigation, as well as the three previously installed monitoring wells, and collection of one surface soil (location 5MW-4A) and three subsurface soil samples (locations 5MW-4A., 5MW-4B, and 5MW-4D).

### 3.33.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-67 shows the location and concentrations where one or more constituent exceeded an SC.

No constituents were detected in surface soil samples at concentrations greater than the SC. One SVOC, benzo(a)pyrene (SC = 0.2 mg/kg), was detected at 0.34 mg/kg in a duplicate sample from location L-5-MW-004 at a depth of 4-6 ft bgs.

Two VOCs, methylene chloride (SC = 3 ug/L), a common laboratory contaminant, and PCE (SC = 1 ug/L), were detected in at least one groundwater sample at Site 5. Methylene chloride was detected at three sampling locations with the maximum concentration of 9 ug/L being collected from location L-DM5-2. PCE was detected in samples from four locations with the maximum concentration of 14 ug/L detected at location L-5-MW-004. RDX (SC = 2ug/L) was detected at 48.1 ug/L in a groundwater sample collected from location L-DM5-2 in May 1988; however, it should be noted that RDX was non-detect in samples collected from the same location in April 1988 and February 2001. Cyanide (SC = 100 ug/L) was detected at concentrations greater than the SC in groundwater samples from three locations with the maximum detection of 2400 D ug/L collected at location L-DM5-1; however, most recent data indicates that the results for cyanide in all wells as non-detect. Several naturally occurring metals including aluminum (SC = 200 ug/L), arsenic (SC = 3 ug/L), iron (SC = 300 ug/L), manganese (SC = 50 ug/L), and zinc (SC = 2000 ug/L), were detected at concentrations greater than the SC. The respective maximum concentrations were: 689.99 ug/L (from L-DM5-1), 4.02 ug/L (from L-DM5-2), 5800 ug/L (from L-MW-3), 1800 ug/L (from L-DM5-2), and 5399 ug/L (from L-DM5-2).

Groundwater at this site is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.33.4 Summary of Risk Assessments

#### 3.33.4.1 Human Health

An HHRA was completed in 2005 for Site 5 receptors in the Phase III- 1A RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for

remedial action. The results of the HHRA calculations for carcinogenic risk at Site 5 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Industrial/Research Worker: carcinogenic risk number of 9E-06/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 2E-07/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker (groundwater): carcinogenic risk number of 2E-08/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Future Adult Resident (soil): carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1.
- Future Child Resident (soil): carcinogenic risk number of 3E-05/ noncarcinogenic HI of 5.
- Future Adult + Child Resident (mixed soil): carcinogenic risk number of 7E-05/noncarcinogenic HI not evaluated.

#### 3.33.4.2 *Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.33.4.3 *Ecological*

Site 5 was evaluated as part of the Northern Area L assessment in the Phase III BERA. Due to safety issues related to UXO, neither surface nor subsurface samples were collected at Site 5 for the purpose of the ecological evaluation; soil samples collected during the installation of monitoring wells along with soil, sediment, and surface water samples collected from other Sites included in Northern Area L (i.e., Sites 17, 18, 36,

171, and 188) were used. Other lines of evidence included wildlife exposure modeling, small mammal surveys, bird nesting success surveys and rodent sperm analyses.

The food web exposure models indicated that the potential for adverse effects on reproduction in small mammals or birds. However, the predicted effects were not observed in the field, with small mammal surveys and nesting success surveys demonstrating that capture rates and hatching success within Northeastern Area L were comparable to reference areas. Similarly, rodent sperm analyses showed no adverse effects on reproduction parameters. Therefore, the overall weight of evidence indicates that adverse effects, if any, are minimal and not significantly impacting the local populations of small mammals or birds.

Food web modeling indicated potential risks; however, the overall weight of evidence indicated no significant effects on ecological populations.

#### *3.33.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within or less than the generally acceptable risk range for the current and future industrial/research worker and current and future construction worker of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than 1 for the current and future industrial/research and current and future construction workers;
- Lead is not a concern at this site; and
- Ecological risks are expected to be minimal.

For the hypothetical residential use risk scenarios evaluated, risks are within the generally acceptable risk range of 1E-06 to 1E-04, but the HI is greater than 1 for the child resident.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use. Note that munitions or

explosives of concern (MEC) issues associated with these sites are being handled under the Military Munitions Response Program (MMRP) and later decision documents will address safety issues associated with the sites. In the meantime the proposed action under the IRP will ensure that the site use and site access control does not change.

### **3.34 PICA-162/Site 6 – Shell Burial Area near Building 3100**

#### 3.34.1 Site History

PICA-162 (052)/Site 6 consists of the shell burial area near Building 3100 (PICA-075/Site 36) located west of the building in the area of two explosion craters caused by the 1926 Lake Denmark explosion. Site 6 is approximately two acres in size, and is located approximately 1,800 ft east of the southern outlet of Picatinny Lake. Site 6 is presented on Figure 3-68.

MEC and building debris from the 1926 Lake Denmark explosion were deposited in the craters, and the area was then used as an ordnance dumping area. The 2008 Army Defense Environmental Restoration Program Installation Action Plan states that mines, depth charges, fuses, projectiles, explosives, ammunition, propellants, and possibly rocket fuels had been dumped in the burial area. The area was used as an ordnance dumping area until 1945. The area was then covered with approximately 20 ft of fill material, fenced, and marked with warning signs. Access to the 3100 burial area is limited. The area is also heavily forested, indicating the lack of recent intrusive activities and vegetation control. A sanitary sewer line runs through the middle of the site. Although the date of installation is not known, this line was present in a 1969 plate map. The 1981 Installation Assessment addendum stated that the shell burial areas also contained acids, pickling liquors, cyanide, phenol, and propellants.

Site 6 is currently heavily vegetated with trees and grass. The area is inactive, fenced off and posted with warning signs. There are currently no plans for future construction at this site.

Groundwater flow at Site 6 is generally west, and groundwater at this site is included in the Mid-Valley Groundwater action.

### 3.34.2 Previous Investigations

Three previous studies have investigated the Site 6 area. A groundwater-monitoring program was initiated in 1981 to assess areas with known groundwater contamination. A site investigation was performed at Site 6 in 1988, and Phase III-1A sampling activities were conducted between November 1998 and July 1999.

One well (MW-5) was installed downgradient of the site and to the west in 1981 as part of a groundwater monitoring program for known areas of potential contamination. As part of the 1988 site investigation, three additional groundwater monitoring wells (L-DM6-1, L-DM6-2, and L-DM6-3) were installed. All four wells were sampled for VOCs, components of solid propellants, explosives, and metals.

The Phase III-1A sampling activities were conducted from November 1998 through July 1999. This investigation included installation of two monitoring wells (L-6-MW-004 and L-6-MW-004A). One surface soil and two subsurface soil samples were collected during installation of these wells. These soil samples were analyzed for VOCs, SVOCs, explosives, metals, cyanide, and anions. Six groundwater samples were collected during this investigation, one from each of the newly installed wells, and one from each of the previously installed monitoring wells. These groundwater samples were analyzed for VOCs, SVOCs, explosives, metals, cyanide, and anions. In addition, one subsurface soil sample was collected downgradient of the ethylene glycol tank adjacent to building 3100 and analyzed for VOCs, SVOCs, explosives, ethylene glycol, metals, cyanide, and anions. Additional well installation and soil sampling had been identified for the Phase III-1A RI sampling program, but could not be completed due to strict access restrictions and MEC avoidance issues.

Additional groundwater sampling was conducted at some of these wells in 2002 and 2003, as evidenced by data included in the PTA database. The wells were sampled for varying constituents, which included combinations of the following: VOCs, SVOCs, explosives, cyanide, and metals.

### 3.34.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-69 shows the location and concentrations where one or more constituent exceeded an SC.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

In soils, four SVOCs were detected at concentrations greater than their SC. All four constituents were detected at sample location L-6-MW-004D within the 1 to 3 ft interval. Benz(a)anthracene (SC = 2 mg/kg) was detected at a concentration of 2.46 D mg/kg; benzo(a)pyrene (SC = 0.2 mg/kg) was detected at a concentration of 2.35 D mg/kg; benzo(b)fluoranthene (SC = 2 mg/kg) was detected at a concentration of 2.56 D mg/kg; and dibenz(a, h)anthracene (SC = 0.2 mg/kg) was detected at a concentration of 0.38 JD mg/kg. No VOCs, explosives, metals, cyanide, or anions were detected at concentrations that exceeded their respective SC in surface or subsurface soils.

In groundwater, three VOCs (methylene chloride, PCE, and TCE) were detected at concentrations greater than their respective SC. In 1988, four groundwater samples from wells L-6-MW-005, L-DM6-1, L-DM6-2, and L-DM6-3 exhibited methylene chloride concentrations that were greater than the SC (3 ug/L). Subsequent samples collected from these wells at later dates, however, show that concentrations were less than detection limits or less than the SC. Methylene chloride is a common laboratory contaminant, and the concentrations of methylene chloride in all four wells during the 1988 sampling event were almost identical (three samples contained concentrations of 6 ug/L, while one was 5 ug/L). Therefore, it is likely that the methylene chloride concentrations observed in the sample results were due to systemic laboratory contaminant.

PCE was detected in a groundwater sample from monitoring well L-DM6-1 at a concentration of 30.9 ug/L (SC = 1 ug/L) in 1988. Two groundwater samples were collected subsequently (1999 and 2002), and neither sample exceeded the PCE SC. TCE was detected at concentrations greater than its SC (1 ug/L) in samples from four monitoring wells. The maximum detections of TCE at these four wells were: 14.0 ug/L at monitoring well L-6-MW-004, 17.0 ug/L at monitoring well L-6-MW-004D, 2.0 ug/L at monitoring well L-DM6-1, and 6.2 ug/L at monitoring well L-DM6-2. At two of these wells, L-DM6-1 and L-DM6-2, results from more recent sampling events indicate that concentrations no longer exceed SC, but at the other two wells, while concentrations have decreased, they still exceed the TCE SC.

One SVOC, bis(2-ethylhexyl)phthalate, a common laboratory contaminant, was detected in groundwater samples at concentrations above its SC (3 ug/L) : 3.29 J ug/L at L-MW-5, and 7.40 J at L-6-MW-004. Five metals were detected in groundwater samples in concentrations greater than their respective SC. The maximum detections of four of the metals were from groundwater samples collected from monitoring well L-6-MW-004D: aluminum (SC =200 ug/L) was detected at a maximum concentration of 10,900 ug/L, iron (SC =300 ug/L) was detected at a maximum concentration of 7,900

ug/L, lead (SC = 5 ug/L) was detected at a maximum concentration of 11 ug/L, and manganese (SC = 50 ug/L) was detected at a maximum concentration of 200.00 ug/L. The fifth metal, arsenic, was detected at a concentration greater than its SC (3 ug/L) at monitoring well L-6-MW-004 with a concentration of 3.19 J ug/L. No explosives or anions were detected at concentrations that exceeded their respective SC.

Groundwater for PICA-162/Site 6 is addressed through the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### 3.34.4 Summary of Risk Assessments

##### 3.34.4.1 Human Health

An HHRA was completed in 2005 for Site 6 receptors in the Phase III-1A RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 6 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current and Future Industrial Research/Worker: carcinogenic risk number of 1E-04/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 3E-07/ noncarcinogenic HC of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 1E-07/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Future Adult Resident (soil): carcinogenic risk number of 3E-04/ noncarcinogenic HI of <1.
- Future Child Resident (soil): carcinogenic risk number of 2E-04/ noncarcinogenic HI of <1.

- Future Adult + Child Resident (soil): carcinogenic risk number of 4E-04/noncarcinogenic HI of <1.

#### 3.34.4.2 *Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.34.4.3 *Ecological*

Site 6 was evaluated as part of the Northern Area L assessment in the Phase III BERA. Due to safety issues related to UXO, neither surface nor subsurface samples were collected at Site 6 for the purpose of the ecological evaluation; soil samples collected during the installation of monitoring wells along with soil, sediment, and surface water samples collected from other Sites included in Northern Area L (i.e., Sites 17, 18, 36, 171, and 188) were used. Other lines of evidence included wildlife exposure modeling, small mammal surveys, bird nesting success surveys and rodent sperm analyses.

The food web exposure models indicated that the potential for adverse effects on reproduction in small mammals or birds. However, the predicted effects were not observed in the field, with small mammal surveys and nesting success surveys demonstrating that capture rates and hatching success within Northeastern Area L were comparable to reference areas. Similarly, rodent sperm analyses showed no adverse effects on reproduction parameters. Therefore, the overall weight of evidence indicates that adverse effects, if any, are minimal and not significantly impacting the local populations of small mammals or birds.

#### 3.34.4.4 *Summary of Risks*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and

- Ecological risks are expected to be minimal.

For the hypothetical risk scenarios evaluated, risks are greater than the generally acceptable risk range of 1E-06 to 1E-04, and the HI is less than 1.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

Note that MEC issues associated with this site are being handled under the MMRP and later decision documents will address safety issues associated with the site. In the meantime, the proposed action under the IRP will ensure that the site use and access control does not change.

### **3.35 PICA-175/Site 115– Building 611, Ammunition Testing Facility**

#### 3.35.1 Site History

Building 611 was constructed in 1965 and has been used for the testing of small munitions. Additionally, the building is equipped with a portable X-ray unit and a darkroom for the development of X-ray films. The darkroom is located on the second floor above the work area at the south end of the building. The location of Site 115 is shown on Figure 3-70.

According to an undated transformer inventory, there are three 75-KVA transformers located inside the building. In 1981, the transformers were considered to be PCB transformers. According to the Picatinny transformer database compiled in 1988, the transformers were in fair condition at that time and contained 34 gallons of dielectric fluid.

Building 611 has a RCRA permitted satellite waste accumulation area located inside the building. Materials stored in the area include used spray paint cans, x-ray developer, and fixer. Materials used in the former range area were ammunition.

Although little information exists regarding the testing practices at the range area, interpretation of historic maps and aerial photographs indicates that guns were placed in the area southwest of Building 611 and fired into the slug-butt near Building 611A.

The slug-butt is still on the hillside in a deteriorated condition. This range area was used from the late 1920s to the 1940s.

Discharge to the environment is limited to the materials that may have been discharged during range operation. Little information exists regarding the operating practices at this range area.

There are currently no plans for future construction at PICA-175/Site 115.

### 3.35.2 Previous Investigations

Dye tests performed in 1991 indicated that the darkroom sink as well as sanitary wastes discharge to the sanitary sewer system (Foster Wheeler 1991).

During the PA/SI performed in 1996, one surface soil sample 611 SS-A was collected from the former firing area.

The Phase III 2A/3A RI sampling activities at Site 115 were performed from October 2000 to May 2001. Sampling program for this site included:

- Installing and surveying one monitoring well (M-115-MW-001);
- Collecting one groundwater sample from the new well;
- Collecting 35 surface soil samples: four of the samples (M-115-SS-001 to M-115-SS-004) were collected within the former firing area. These samples were analyzed for baseline explosives, nitrocellulose, nitroguanidine, nitroglycerine, PETN, and TAL metals. Three samples (M-611B-SS-1 to M-611B-SS-3) were collected in the immediate vicinity of the metal plate containing bullet holes and analyzed for depleted uranium. The initial sampling round involved collecting 24 samples from a grid of approximately 75 ft by 100 ft with 20-foot spacing between samples. These samples were analyzed for baseline explosives, nitrocellulose, nitroguanidine, nitroglycerine, PETN, and TAL metals. The second sampling round involved collecting four samples. These samples were only analyzed for copper and lead.
- One subsurface soil sample (L-115-SB-001) was collected from 9.5 to 10.0 ft bgs at the location of surface soil sample M-115-GR-C2. Sample L-115-SB-001 was analyzed for arsenic, lead, and copper.

- Four wipe samples were collected from the front of the 1.5 ft by 1.5 ft metal plate containing bullet holes. These samples were analyzed for gross alpha.

### 3.35.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-71 shows the location and concentrations where one or more constituent exceeded an SC.

Lead was detected in eight surface soil samples (M-115-GR-B1, M-115-GR-B2, M-115-GR-C2, M-115-GR-C3, M-115-GR-D1, M-115-GR-D2, M-115-GR-D3, and M-115-GR-E2) and one subsurface soil sample (L-115-SB-001) with concentrations greater than the SC (800 mg/kg). Concentrations of lead in surface soil samples ranged from 856 J mg/kg (M-115-GR-B1) to 2,910 JD mg/kg (M-115-GR-C2); the concentration of lead in the subsurface soil sample (L-115-SB-001) was 1,030 J mg/kg. Arsenic (SC = 19 mg/kg) was detected in one surface soil sample, collected at sample location M-115-GR-C2, at a concentration of 22.6 D mg/kg.

The only constituent detected in groundwater at a concentration greater than its SC (200 mg/L) was aluminum, a generally naturally occurring metal, at a concentration of 7,400 J ug/L (M-115-MW-001).

Gross alpha concentrations of the four wipe samples were less than the natural background level for soil as determined during the background study.

### 3.35.4 Summary of Risk Assessments

#### 3.35.4.1 Human Health

An HHRA was completed in 2005 for Site 115 receptors in the Phase III 2A/3A RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 115 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Current Industrial/research worker: carcinogenic risk number of 9E-06/ noncarcinogenic HI of <1.
- Current Construction Excavation worker: carcinogenic risk number of 7E-07/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Current Adult resident (mixed soil): carcinogenic risk number of 2E-05/ noncarcinogenic HI of 1.
- Current Child resident (mixed soil): carcinogenic risk number of 2E-05/ noncarcinogenic HI of 7.
- Current Adult+Child resident (mixed soil): carcinogenic risk number of 4E-05.

### 3.35.4.2 Lead Blood Model Results

The current and reasonably anticipated future use scenarios were reevaluated at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 535 mg/kg, less than the calculated PRG of 1,092 mg/kg.
- Current Construction Worker (subsurface soil): average lead concentration of 1,030 mg/kg, less than the calculated PRG of 1,092 mg/kg.

Additionally, human health risks associated with lead exposures were calculated for use scenarios not reasonably anticipated and are as follows:

- Current Adult Resident (mixed surface and subsurface soil): The average lead concentration is 550 mg/kg, which is less than the calculated PRG or 1,092 mg/kg.

### 3.35.4.3 Ecological

Site 115 is small and has poor quality habitat (a slope littered with metallic debris and devoid of vegetation). However, several contaminants have been identified that could

pose a risk to wildlife. Given its location adjacent to wooded habitats and headwaters of BSB, an ERA was conducted to evaluate exposures to terrestrial species. This analysis suggested elevated risks to the white-footed mouse and American robin associated with a few inorganic chemicals. However, analysis of the data distribution indicates that elevated concentrations of the primary risk drivers are limited to the slug butt site, which occupies only a small portion of the site. Given the localized nature of the elevated concentrations, the overall impact on local populations would be minimal.

#### 3.35.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-06 to 1E-04;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- Ecological risks are expected to be minimal.

For the hypothetical residential use risk scenarios evaluated, risks are within the generally acceptable risk range of 1E-06 to 1E-04, but the HI is greater than 1. Lead is not a concern for the hypothetical residential use risk scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.36 PICA-175/Site 151 – Building 600 Change House**

#### 3.36.1 Site History

PICA-175 (133)/Site 151 consists of Building 600, which is a one-story structure constructed in 1942 as a change house. Site 151 is located near the intersection of 5<sup>th</sup> Place and 10<sup>th</sup> Street in the northeastern portion of Area H. The location of Site 151 is shown on Figure 3-72. Change house equipment included laundry, lavatory, and

shower facilities. Because personnel who used these facilities worked with explosives, wastewater from washing operations may have been contaminated with explosive compounds such as HMX, RDX, and Composition B. The explosives-contaminated wastewater was discharged to a dry well (a manhole connected to the storm sewer system) before Building 600 was connected to the sanitary sewer system in the 1960s. Beginning around 1978, Building 600 was used as a training ground for military Special Weapons Assault Team (SWAT) training maneuvers. The training maneuvers involved the use of hand grenades, rockets, and other small-scale explosives. In 1992, Building 600 underwent asbestos abatement and was demolished.

There are currently no plans for future construction at PICA-175 (133)/Site 151.

### 3.36.2 Previous Investigations

Investigations at Site 151 include Phase II RI sampling activities conducted between December 1995 and October 1996, and follow-up investigations conducted between November 2000 and December 2000.

The initial Phase II RI program for Site 151 included installation of one monitoring well (H-151-MW-001), and collection of three surface soil samples (H-151-SS-1A, H-151-SS-2A, and H-151-MW-001A) and one groundwater sample for off-site analysis of metals, anions, and explosives. Other surface soil samples were collected for on-site analysis. Subsurface soil samples were not collected due to the presence of competent bedrock within 4 ft of the surface. Follow-up investigation included installation of one new groundwater monitoring well and collection of two groundwater samples. The sample collected from H-151-MW-001 was analyzed for lead, while the sample collected from well H-151-MW-002 was analyzed for VOCs, SVOCs, lead, explosives, nitroglycerin, and PETN.

### 3.36.3 Nature and Extent of Contamination

Data available from the Picatinny database are included in Appendix A. Figure 3-73 shows the locations and concentrations where one or more constituent exceeded an SC.

There were no SC exceedances for any constituents in surface soil.

Lead was detected at concentrations greater than the SC (5 ug/L) in both groundwater samples collected from H-151-MW-001. Lead in H-151-MW-001 was 25.1 ug/L in 1996

and was 14 ug/L in 2000; however, lead was not detected in the filtered sample (i.e., dissolved lead) collected in 2000. No other constituents exceeded SC in Site 151 groundwater samples.

Groundwater at Site 151 is addressed through the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### 3.36.4 Summary of Risk Assessments

##### 3.36.4.1 Human Health

An HHRA was completed in 2005 for Site 151 receptors in the Phase II RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at Site 151 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

- Current Site Worker: carcinogenic risk number of 6E-0-6/ noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

##### 3.36.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

##### 3.36.4.3 Ecological

Due to the small size of this site and low on-site habitat value (majority of the site is asphalt pavement), and continued use of the site as debris storage area, Site 151 was not evaluated in the phase II ERA.

#### 3.36.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use:

- The carcinogenic risk is less than the generally acceptable range of 1E-04 and 1E-06;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- Ecological risks are not a concern at this site.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.37 PICA-175/Site 152 - Building 604 and 604C, Ordnance Facilities**

#### 3.37.1 Site History

PICA-175 (178)/Site 152 is located in the southern end of Area M and consists of Buildings 604 and 604C. The site layout is shown in Figure 3-74. Building 604 was originally constructed (1928) as a fragmentation tub house. In 1943, the building was converted for use as a physical testing facility. The building is reportedly used as a physical testing/inert storage facility. Materials used in the building include hydraulic fluid, mine grenades, fuzes, calcium carbide, propellants, and small arms ammunition. According to a 1967 Safety Office inspection, the building was used for conditioning tests on completed ordnance. These tests consisted of holding ordnance at reduced temperatures for extended periods of time. The building's explosives allowance was temporarily rescinded in 1967 because of non-compliance of the conditioning boxes with army protocol. A 1968 Safety Office inspection indicates that the explosives allowance had been reinstated and the conditioning tests resumed at that time.

According to a 1977 SOP, the area south of Building 604 was used for the firing of hand grenade fuzes. According to a 1985 Safety Office inspection report, the building was used for truck vibration fuse functioning tests conducted on projectiles, grenades, and fuzes. According to the ANL RI concept plan, drums were washed out south of the building. According to a 1993 memorandum, the explosives allowance in Building 604 was increased to 50 pounds in order to conduct center of gravity and moment of inertia tests on foreign rounds and missile warheads. This memorandum indicated that the tests had been going on since 1991. According to a 1991 memorandum, the building was used concurrently for the installation of fuzes onto projectiles for rail gun testing. There is no storage of energetic materials in the building at this time.

Building 604C was constructed in 1928 as an ammunition tear-down facility. In 1942, an addition to the west end of the building was made to house a saw room and a control for sectioning operations. Two USTs (T1 and T2) were formerly located on the south side of Building 604C. Tank T1 was stainless steel and had a capacity of 500 gallons. Tank T2 was also steel construction with a capacity of 2500 gallons. The tanks were installed in late 1979 and were first used for the collection of red water from the sectioning saw in April 1980. Neither of the tanks were equipped with corrosion protection or leak detection. Weston removed these tanks in spring 1991. Currently, the red water is discharged through a pipe into a plastic aboveground tank inside a hazardous materials cabinet, both the piping and the AST are equipped with secondary containment. In 1958, a milling machine room was added, bringing building 604C to its present size. The building has been used for same purpose since its construction. According to the Argonne RI concept plan (1991), solvents, explosive-contaminated parts, and empty paint cans were stored outside of Building 604C. Additionally, the Argonne RI Concept Plan indicated that drums were washed outside of the building.

There are currently no plans for future construction at PICA-175 (178)/Site 152.

### 3.37.2 Previous Investigations

#### Site 152, Building 604

Three investigations were conducted at this site: 1991 Foster Wheeler Discharge Investigation; 1996 PA/SI and Phase III 2A/3A RI.

According to the 1991 Discharge Investigation, the building generates no wastewater. The stormwater and steam condensate are discharged directly onto the ground.

During the PA/SI, two surface soil samples were collected from the area of Building 604 to investigate potential contaminated areas. One surface soil was collected beneath the location of the former discharge pipe of the temperature conditioning cabinet on the south of the building. The second sample was collected adjacent to the front door on the north side of the building to evaluate potential explosives contamination.

During the RI, five surface samples were collected to assess the potential for explosives contamination in this building.

#### Site 152, Building 604C

A radiation survey was conducted in 1962 to assess the radiation levels in the building during operation of the X-ray unit. According to this survey, the building was equipped with a 140 kilovolt (kV) X-ray (electrically powered) unit at that time. According to a 1976 Picatinny Safety Office Memorandum, sights from a LAW rocket launcher were broken inside Building 604C. The memorandum indicated that after the sights were broken, they were buried outside the building; however, the burial location is not specified. Shortly thereafter, the incident was reported to the Picatinny Radiation Protection Office (RPO) and the sights were dug up and properly disposed. The sights contained Promethium 147 microspheres, which contained 3 millicuries (mCi) per sight. The memorandum does not indicate how many sights were involved in this incident. Upon surveying the building interior, the Picatinny RPO found two contaminated spots. These areas were decontaminated through cleaning and sanding. The Phase III 2A/3A RI Report (Vol. 3 Area M Sites) indicated that while an additional beta-emitter survey was recommended in the PA/SI, it was determined that this survey would not be worthwhile due to the short half-life of beta-emitters. Therefore, no further investigation was recommended.

Asbestos abatement was conducted on a single pipe fitting on the exterior of the building in 1991. The asbestos removal was carried out as a portion of the tank removal performed by Weston.

During the removal of the red-water tanks in 1991, five surface soil samples were collected from the area of the tanks and from the bottom of the excavation. The samples were analyzed for VOCs, SVOCs, metals, and nitrates. No evidence of leaking was observed after the tank removals.

During the PA/SI conducted in 1996, three surface soil samples and one surface water/sediment sample were collected during the site inspection to investigate potential areas of contamination. One surface soil sample (604CSS-A) was collected in front of the sectioning saw room, the other two surface soil samples were collected downgradient of the building - one to the west (604CSS-B) and the other to the south (604CSS-C). Surface water/sediment samples were collected from BSB downstream from the building.

### 3.37.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A. Figure 3-75 shows the location and concentrations where one or more constituent exceeded an SC.

In surface soils, one constituent, 2,4-DNT, exceeded the SC (4.2 mg/kg) at sample location M-604-SS-B during the 1996 sampling event. Samples were collected around this location (M-152-SS-002 and M-152-SS-003) during a 2000 sampling event, and no SC were exceeded. There were no other detections of constituents greater than SC in surface or subsurface soil samples at Site 152.

Thirteen SVOCs were detected at concentrations greater than SC in the sediment sample collected at location M-B-SB-SD-29, 0-1 ft bgs; 0.11 J mg/kg acenaphthene (SC = 0.00671 mg/kg), 0.25 J mg/kg anthracene (SC = 0.03162 mg/kg), 0.25 J mg/kg benz(a)anthracene (SC = 0.0317 mg/kg), 0.41 J mg/kg benzo(a)pyrene (SC = 0.0319 mg/kg), 0.51 mg/kg benzo(b)fluoranthene (SC = 0.0272 mg/kg), 0.22 J mg/kg benzo(k)fluoranthene (SC = 0.0272 mg/kg), 0.56 mg/kg chrysene (SC = 0.0571 mg/kg), 1.16 mg/kg fluoranthene (SC = 0.06423 mg/kg), 0.10 J mg/kg fluorene (SC = 0.0212 mg/kg), 0.19 J mg/kg indeno(1,2,3-c,d)pyrene (SC = 0.078 mg/kg), 0.09 J mg/kg naphthalene (SC = 0.03275 mg/kg), 1.01 mg/kg phenanthrene (SC = 0.0419 mg/kg), and 1.05 J mg/kg pyrene (SC = 0.053 mg/kg). Ten pesticides were detected in at least one sediment sample at Site 152. Concentrations of 0.01 NJ mg/kg 4,4'-DDT (SC = 0.00119 mg/kg), 0.34 NJ mg/kg aldrin (SC = 0.002 mg/kg), 0.81 NJ mg/kg alpha-BHC (SC = 0.00094 mg/kg), 0.71 NJ mg/kg beta-BHC (SC = 0.00094 mg/kg), 0.12 NJ mg/kg endrin (SC = 0.00267 mg/kg), 0.01 NJ mg/kg endrin aldehyde (SC = 0.00267 mg/kg), 0.81 NJ mg/kg gamma-Chlordane (SC = 0.0003 mg/kg), and 0.02 NJ mg/kg heptachlor (SC = 0.0006 mg/kg), were detected at sample location M-B-SB-SD-29, 0-1 ft bgs. Concentrations of 0.4 NJ mg/kg 4,4'-DDE (SC = 0.00142 mg/kg), 0.44 NJ mg/kg 4,4'-DDT (SC = 0.00119 mg/kg), 0.65 NJ mg/kg alpha-BHC (SC = 0.00094 mg/kg), 0.13 NJ delta-BHC (SC = 0.00094 mg/kg), and 0.01 NJ mg/kg heptachlor (SC

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

= 0.00060 mg/kg) were detected at sediment sample location M-B-SB-SD-28, 0-1 ft bgs. The dioxin 1,2,3,4,6,7,8-heptachlorodibenzo-p-dioxin (SC = 0.000085 mg/kg) was also detected at M-B-SB-SD-28, at a concentration of 0.01 J mg/kg. Concentrations of 40.4 J mg/kg copper (SC = 28 mg/kg), 63.1 J mg/kg lead (SC = 38.8 mg/kg), and 175 J mg/kg zinc (SC = 171 mg/kg) were detected at M-B-SB-SD-29. Concentrations of 2.29 mg/kg cadmium (SC = 1.70 mg/kg), 30.4 mg/kg copper, and 81.7 J mg/kg lead were detected at M-B-SB-SD-28.

Concentrations of 210 ug/L aluminum (SC = 190 ug/L) and 5.2 ug/L lead (SC = 3.2 ug/L) were detected in a surface water sample collected at location M-B-SB-SW-28.

Surface water and sediment at Site 152 have been evaluated, and the remedy selection can be found in the Final ROD, GPB/BSB, December 2004.

### 3.37.4 Summary of Risk Assessments

#### 3.37.4.1 Human Health

As all Phase III 2A/3A RI media samples collected and analyzed for Site 152 did not document any constituent concentrations above analytical detection limits, no COPCs were selected, and no risks or hazards were quantified.

#### 3.37.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.37.4.3 Ecological

No chemicals were detected in soil during the Phase III RI; thus, no COPCs were selected for soil at Site 152. Sediment collected from BSB indicated copper, cadmium, and zinc above their SC. This area of BSB was addressed in the GPB/BSB ROD. No further ERA was recommended for Site 152 in the SLERA report.

#### 3.37.4.4 Summary of Risks and Hazards

There were no risk assessments performed for this site, therefore:

- The carcinogenic risk and noncarcinogenic HIs were not quantified;

- Lead is not a concern at this site; and
- Ecological risks are not a concern at this site.

Because risks were not evaluated for reasonably anticipated land use or hypothetical residential use and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.38 PICA-175/Site 153 - Building 606, Electronics Lab and Storage Building**

#### 3.38.1 Site History

PICA-175 (179)/Site 153 consists of Building 606, which was constructed in 1960 as an electronics lab and explosives testing support facility. The site is located in the southwestern portion of Area M at the intersection of Greenberg and James Roads. The location of Site 153 is shown on Figure 3-76. The last known functions of Building 606 were as an electronics lab and storage building. The building was categorized as a research and development testing facility from 1960 to 1982, and as an ordnance facility since 1982. Charges were tested from 1960 until 1982 at an outdoor explosives test bay on the building's west side. Building 606 was equipped with a slingshot low-velocity-impact test machine. The machine was used to record low velocity impacts of detonators and tetryl leads. The building was also equipped with an x-ray flash unit that was used to obtain x-ray photographs of impact, ablation, and fuse arming. Equipment formerly tested at the building included mines, grenades, projectiles, detonators and fuses. Materials used in the building included Freon, compressed gasses, x-ray developer, x-ray fixer, and chlordane. Building 606 reportedly has a RCRA permitted satellite waste accumulation area for generation of x-ray developer in quantities of 30 gallons per year, and rinse water in quantities of 150 gallons per year generated from a darkroom on the building's west side. Prior to the late 1980s, rinse water from the x-ray developing process was rinsed down a sink that discharged directly to the ground on the building's west side.

According to the PTA transformer database, there were three 15 KVA transformers (pole-mounted) at the facility in 1989. The PCB content of these transformers is unknown. Additionally, no information was available to detail if any investigation or removal/replacement activities have been conducted relative to these transformers.

Building 606 is equipped with two underground water storage tanks. The tanks were used for the storage water that was trucked in until 1966 when the building was

connected to water service. Available information does not indicate that these tanks have ever been used for any materials other than water.

There are currently no plans for future construction at PICA-175 (179)/Site 153.

### 3.38.2 Previous Investigations

According to the 1991 investigation report (Foster Wheeler), the building roof drains directly to the parking lot. The sink on the building's south side was dye tested in 1991 and indicated that the sink discharge goes to the ground. It was unclear, however, in this report if the discharge was on the south side or the west side because the report indicated both locations. Further clarification was not provided.

In 1992, a UXO clearance was performed on the north and west side of the building for the purposes of installing surface water drainage swales. No UXO was found as a result of this survey.

Four surface soil samples (M-153-606SS-A through M-153-606SS-D) were collected during the 1991 Phase III PA/SI conducted to assess potential areas of contamination related to ordnance testing. These samples were analyzed for SVOCs, pesticides, inorganics, anions, and explosives.

### 3.38.3 Nature and Extent of Contamination

Data were not available from the Picatinny database for Site 153, however the administrative record was reviewed for pertinent data. Figure 3-77 shows the locations where constituent concentrations exceeded the SC.

In surface soils, pesticides alpha-chlordane (SC = 1 mg/kg), gamma-chlordane (SC = 1 mg/kg), dieldrin (SC = 0.2 mg/kg), heptachlor (SC = 0.7 mg/kg), and heptachlor epoxide (SC = 0.3 mg/kg) were detected in sample M-153-606SS-B at respective concentrations of 26 mg/kg, 19 mg/kg, 1.6 mg/kg, 1.1 mg/kg, and 1.6 mg/kg, which are concentrations that are greater than SC. This sample was collected from soil beneath the reported location of the dark room sink discharge pipe on the western side of Building 606. No other constituents were detected at concentrations greater than SC.

### 3.38.4 Summary of Risk Assessments

#### 3.38.4.1 *Human Health*

An HHRA was not performed for Site 153 because of the limited contamination at the site. The Site 153 data were compared to USEPA Regional Screening Levels; however, and that comparison indicated that there were samples that exceeded the USEPA Residential RSL for chromium and heptachlor epoxide in soil (Table 3-2).

#### 3.38.4.2 *Lead Blood Model Results*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.38.4.3 *Ecological*

No ERA was performed for Site 153 due to the limited contamination, small size and the level of industrialization of the site.

#### 3.38.4.4 *Summary of Risks and Hazards*

There were no risk assessments performed for this site, therefore:

- The carcinogenic risk and noncarcinogenic HIs were not quantified;
- Lead is not a concern at this site; and
- Ecological risks are not a concern at this site.

Because risks were not evaluated for reasonably anticipated land use or hypothetical residential use and concentrations of some constituents exceed residential screening criteria (Table 3-2), this site cannot be released for unrestricted use.

### **3.39 PICA-175/Site 154 – Buildings 617 and 617G, Field Office and Disassembly Facility**

#### 3.39.1 Site History

PICA-175 (180)/Site 154 occupies approximately 0.5 acres near the intersection of 20th Avenue and 20th Circle in the southern portion of Area M and consists of

Buildings 617 and 617G. The layout of Site 154 is shown on Figure 3-78. The Site 154 buildings were constructed in 1928. Building 617 was originally constructed as a gun building that shot into the slug-butt behind Building 611. The building was also used as a testing and loading facility for the gun test range. This use continued until the late 1950s. From the 1960s until the late 1970s, the building was used as a general ordnance facility and environmental testing facility. The building has also been used as an office. Materials used in the building during its tenure as an ammunition assembly house (shell cleaning, assembly, photography, and office and storage use) include acetone and potentially other cleaning solvents. As an environmental test facility, materials used would have been limited to small amounts of lubricating fluids and assembled ordnance components. Depleted uranium penetrators were stored in the building during its use as an office facility.

Building 617G was constructed as a gun and powder shed and was also used for storage and minor maintenance and repair of howitzers tested in the Building 611 range area. This use continued until the 1950s, after which time the building was used for machining ferrous and non-ferrous metals. The building was used to fabricate, modify, and repair small tools, metal parts, and sometimes machining loaded ammunition, and operations also included grinding, painting, assembly, calibration, and testing of machined materials. Explosions have occurred in the building, most notably in May 1964 and October 1993, but no opportunity for environmental contamination is thought to be associated with the incidents. Materials used in the building included fuzes, grenades, mines, and projectiles. Trichloroethane was also used for cleaning parts. Building 617G is noted as being equipped with a RCRA permitted satellite waste accumulation area, in which small quantities of aerosol paint cans, oils, and oily rags have been stored. It is not known whether this area continues to be a RCRA permitted satellite waste accumulation area. According to a radiation survey, Building 617G was also used for disassembling DU containing projectiles.

There are currently no plans for future construction at PICA-175 (180)/Site 154.

### 3.39.2 Previous Investigations

#### Site 154, Building 617, Administration Building

A radiological survey conducted in Building 617 indicates that the building contained DU penetrators in 1982. These penetrators were stored in a file cabinet inside the building. During this survey, radiation levels were measured to determine that the penetrators were being stored safely. In 1985, a radiological survey meter was turned

in because it was no longer being used. No data was located for this investigation and no further investigation was conducted.

The 1991 Foster Wheeler Discharge Investigation Report indicates the discharge from one sink in the building was routed to a cement stormwater trough on the southeast side of the building. All other facilities in the building discharged to the septic tank. Stormwater from the building roof discharged to a concrete trough and then to the ground.

During the PA/SI performed in 1996, three surface soil samples (M-154-617SS-A, -B, and -C) were collected during the SI to investigate the sink discharge to the stormwater collection system and potential undocumented spills of solvent, oil, or explosives. Samples were analyzed for VOCs, SVOCs, pesticides, PCBs, explosives, metals, and anions.

#### Site 154—Building 617G, Disassembly Facility and Machine Shop

According to a radiation area survey, Building 617G was used in 1978 for the disassembly of projectiles equipped with DU cones, but no measurable contamination was present after the disassembly in the building.

According to the 1991 Foster Wheeler Discharge Investigation, stormwater from the roof of the building is discharged to the parking lot on the building's northwest side. The report does not discuss any other water discharges.

As part of the PA/SI conducted in 1996, two surface soil samples (M-154-617GSS-A and M-154-617GSS-B) were collected from the building's northwest and southeast side's during the SI and analyzed for VOCs, SVOCs, pesticides, PCBs, explosives, metals, and anions.

#### 3.39.3 Nature and Extent of Contamination

Data were not available from the Picatinny database; however the administrative record was reviewed for pertinent data. No SC were exceeded in any of the surface soil samples collected at Site 154. Historical sample locations are shown on Figure 3-79. The historical data were also compared to residential NJDEP SRS and USEPA RSLs as well as background concentrations for Picatinny Arsenal, and there were no exceedances of the background concentrations or SRS; therefore, this site qualifies for NFA.

### 3.39.4 Summary of Risk Assessments

#### 3.39.4.1 Human Health

An HHRA was not performed for Site 154, as contaminants were not detected at concentrations greater than SC.

#### 3.39.4.2 Lead Blood Model Results

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at this site.

#### 3.39.4.3 Ecological

No ERA was performed at Site 154 due to lack of contamination identified at the site.

#### 3.39.4.4 Summary of Risks and Hazards

Human health and ecological risk assessments were not conducted due to the low concentrations of potential contaminants at Site 154. The historical data were compared to the NJDEP Residential SRS and the USEPA RSLs (Tables 3-3 and 3-4), and there were no exceedances. Therefore, this site qualifies for NFA.

## 3.40 PICA-200/Site 200 – Area L Other Buildings

### 3.40.1 Site History

PICA-200/Site 200 consists of 13 building, 6 of which are discussed in this FS. PICA-200/Site 200 DSERTS is composed of six individual buildings within Area L, including Buildings 1030, 1037, 1038, 1090, 1414, and 1437. The buildings of Site 200 are shown on Figures 3-80, 3-82, 3-84, 3-86, and 3-88.

#### Building 1030, Acid Tank Farm

Building 1030 may have been constructed in 1949 (as indicated on 1949 engineering drawings), however, the actual date of construction is unknown. The building's construction consisted of steel tanks on concrete piers, a wood platform, and a 10 ft by 15 ft wood frame building. Originally, the building consisted of five ASTs and a scale tank with its own housing for weighing acid located within the building. In 1953, an

aluminum tank was added. The cumulative storage capacity of the tanks was 200,800 pounds of acid. The area beneath the tanks was covered with gravel and had a 6-inch high berm for secondary containment. Building 1030 has been inactive since the 1980s.

There are currently plans for future construction of a Nano Technology Facility adjacent to Building 1090 at PICA-200/Site 200.

#### Building 1037, Waste Water Incinerator

Building 1037 is located off of Robinson Rd in the 1000 and 1300 area enclosures. The 20 ft x 35 ft four story building has concrete and metal grating floors. This building was constructed in 1957. This operated as a vertical draft incinerator, and then was converted in the early 1970s to a fluidized bed incinerator. The building has been inactive since 1977. The building was listed on building demolition lists in 1986 and 1987, and was scheduled to be flashed in 1987.

#### Building 1038, Solvent Storage Facility

Building 1038 was constructed in 1956. This building had two ASTs of 1,000 gal and 1,200 gal capacities. The building functioned as a solvent storage facility until approximately the mid-1970s. The building was then refurbished in the late 1970s to provide toluene for a TNT manufacturing line for building 1031. However, a fire in building 1029 destroyed the TNT remote control system. Prior to the fire, the TNT remote control system had only been operated with water as part of function testing of the system.

#### Building 1090, Assembly and Packaging Building

Building 1090 was constructed in 1948 as a screening and packing facility as part of the haleite (ethylenedinitramine high explosives) plant. The building was then modified (exact date unknown) to function as an assembly and packing facility for a variety of ordnance. Building 1090 continued operating in this capacity until it ceased operations in the early 1970s. The southern end of building 1090 then reopened in the late 1970s to house a shell X-ray Automatic Inspection Device for Explosive Charge in Shell system (AIDECS) using a sealed Cobalt-60 source encased in lead. The AIDECS was active from 1980 to 1982. The building has been inactive since 1982.

#### Building 1414, Propellant Dry House

Building 1414 was constructed in 1948 as a propellant dry house. The process of drying propellant involves placing trays of propellant in the building's main room and forcing warmed air into the building from the fan house. Drying propellant in this manner would cause nitroglycerin to condense on the interior of the building. The building was equipped with a catch pan to collect the condensate. Equipment at the dry house was rinsed with soap, water, and acetone to remove the nitroglycerin condensate.

#### Building 1437, Cast Propellant Powder Plant

Building 1437 was built in 1956 as a cast propellant plant. The building's walls and roof are constructed of corrugated asbestos. This building is located in the triple base propellant manufacturing and processing area of the arsenal. Triple based propellants consist of nitrocellulose, nitroguanidine, and nitroglycerin. The building functioned as a cast propellant plant from its construction until the late 1970s. It was then relocated in the early 1980s and subsequently used as a pulverizing facility for oxidizing ingredients (chlorates and perchlorates) used in the manufacture of triple based propellants. This building ceased operation in 1985.

#### 3.40.2 Previous Investigations

The PICA-200 Buildings were included as part of the 1996 PA/SI for VOCs, SVOCs, pesticides, PCBs, explosives, metals and anion analysis in soil. Based upon the results of the PA/SI, a subsequent Phase III 2A/3A RI was conducted. The extent of contamination at the site has been delineated by the previous sampling events, and no additional sampling has been proposed.

#### 3.40.3 Nature and Extent

Data available from the Picatinny Database are included in Appendix A.

#### Building 1037

Figure 3-81 shows the locations associated with Building 1037, and concentrations where one or more constituent exceeded an SC.

### Building 1037

In surface soils, only one constituent exceeded its SC. Octachlorodibenzodioxin, with an SC of= 0.061 mg/kg was detected at a concentration of 0.18 J mg/kg. No other constituents exceeded SC in surface soils.

In surface water sample location L-161-SW-5, TCE with an SC of= 1 ug/L, did not exceed the SC in either sampling of 2001, but was detected with a concentration of 1.3 ug/L in November 2003. No other constituents exceeded SC in surface water samples.

In groundwater, TCE (SC = 1 ug/L) was detected in sample locations L-161-MW-4A and L-161-MD-4B. At L-161-MW-4A, TCE was detected at a concentration of 5.6 ug/L in 2002 and 6 ug/L in 2003. At L-161-MW-4B, TCE was detected at a concentration of 21 ug/L in 2002, 16 ug/L in 2003, 10.6 ug/L in February 2008, and 9.05 ug/L in September 2008. Iron (SC = 300 ug/L) was detected at a concentration of 11,000 ug/L at sample location L-161-MW-4A.

### Buildings 1030 and 1038

Figure 3-83 shows the locations associated with Buildings 1030 and 1038, and concentrations where one or more constituent exceeded an SC.

In surface soils, arsenic exceeded its SC of= 19 mg/kg in sample locations L-B1030-SS-1 and L-B1030-SS-3 with respective concentrations of 56.1 mg/kg and 62.6 mg/kg.

TCE was the only constituent to exceed its SC of= 1 ug/L in the piezometer surface water sample (L-PZ-01). TCE was detected at 2.9 ug/L in 2001 and 29 ug/L in 2004. No other constituents exceeded SC in surface water samples.

In groundwater, TCE (SC = 1 ug/L) was detected at L-B1038-MW-1, L-B1038-MW-2, L-B1038-MW-3, and L-B1038-MW-4 with maximum concentrations of 89 D ug/L (in 2001), 68 D ug/L (in 2003 and 2004), 45.9 ug/L (in 2008), and 30 ug/L (in 2004) at respective sampling locations. The VOC PCE (SC = 1 ug/L) was detected at location L-B1038-MW-1 with a concentration of 1.13 ug/L in February 2008. Metals aluminum (SC = 200 ug/L), iron (SC = 300 ug/L), and manganese (SC = 50 ug/L) were also detected at location L-B1038-MW-1 at concentrations 3600 J ug/L, 6400 J ug/L, and 140 J ug/L which exceed their respective SC.

### Building 1090

Figure 3-85 shows the locations associated with Building 1090, and concentrations where one or more constituent exceeded an SC.

There were no constituents that exceeded their SC in surface or subsurface soil, sediment, or surface water sampling locations.

In groundwater, the explosive RDX (SC = 2 ug/L) was detected at L-B1090-MW-1 with concentrations of 16 D ug/L in 2001, 11 D ug/L in 2002, 38 D ug/L in 2003, and 19.6 ug/L in 2008. At L-B1090-MW-2, VOCs 1,2-Dichloroethane (SC = 2 ug/L), benzene (SC = 1 ug/L), and TCE (SC = 1 ug/L) were detected at concentrations greater than their SC. All three had maximum values in 2004, with concentrations of 2.3 ug/L, 3.8 ug/L, and 15 ug/L respectively. At L-148-MW-5B, the TCE was detected, at a concentration of 1.1 ug/L. The explosive RDX was also detected at this location with a maximum concentration of 42 D ug/L in 2003.

#### Building 1414

Figure 3-87 shows the locations associated with Building 1414, and concentrations where one or more constituent exceeded an SC.

In surface soils, benzo(a)pyrene (SC = 0.2 mg/kg) was detected at a concentration greater than its SC at three sampling locations. Benzo(a)pyrene was detected at a concentration of 0.3 J mg/kg at location L-1414A-SS-B (0-1 ft bgs), 0.22 J mg/kg at location L-B1414A-SS-2 (0-1 ft bgs), and 0.33 J mg/kg at location L-B1414A-SS-4 (1-2 ft bgs). No other constituents exceeded SC in surface soil samples.

#### Building 1437

Figure 3-89 shows the locations associated with Building 1437, and concentrations where one or more constituent exceeded an SC.

In groundwater, metals aluminum (SC = 200 ug/L) and iron (SC = 300 ug/L) exceeded SC at sample location L-B1437-MW-1 with concentrations of 1,600 ug/L and 1,300 ug/L, respectively.

Groundwater at PICA-200/Site 200 is addressed in the Mid-Valley Groundwater FS (ARCADIS 2009b).

### 3.40.4 Summary of Risk Assessments

#### 3.40.4.1 Human Health

An HHRA was completed in 2005 for PICA-200 receptors in the Phase III 2A/3A RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at PICA-200 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

#### Building 1030

- Current and Future Industrial/Research Worker: carcinogenic risk number of 1E-05/ noncarcinogenic HI of <1.
- Current and Future Construction Excavation Worker: carcinogenic risk number of 2E-07/ noncarcinogenic HI of <1.

#### Building 1037

No COPCs were selected for industrial use; therefore no HHRA was calculated for anticipated use scenarios.

#### Building 1038

- Current and Future Construction/Excavation Worker: carcinogenic risk number of 3E-07/ noncarcinogenic HI of <1.

#### Building 1090

- Current and Future Construction/Excavation Worker: carcinogenic risk number of 3E-10/ noncarcinogenic HI of <1.

#### Buildings 1414, 1414A, and 1415

No COPCs were selected for industrial use; therefore, no HHRA was calculated for anticipated use scenarios.

Building 1437

- Current and Future Construction/Excavation Worker: noncarcinogenic HI of <1. No carcinogenic hazards were identified.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

Building 1030

- Current and Future On-site Youth Visitor (sediment): carcinogenic risk number of 1E-05/ noncarcinogenic HI of <1.
- Future Adult Resident (subsurface soil): carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1.
- Future Child Resident (subsurface soil): carcinogenic risk number of 3E-05/ noncarcinogenic HI of <1.
- Future Adult + Child Resident (subsurface soil): carcinogenic risk number of 6E-05./noncarcinogenic HI not evaluated.

Building 1037

- Future Adult Resident (mixed soil): carcinogenic risk number of 1E-06/ noncarcinogenic HI of <1.
- Future Child Resident (mixed soil): carcinogenic risk number of 1E-06/ noncarcinogenic HI of <1.
- Future Adult + Child Resident (mixed soil): carcinogenic risk number of 2E-06.

Buildings 1414, 1414A, and 1415

- Future Adult Resident (mixed soil): carcinogenic risk number of 2E-05/ noncarcinogenic HI of <1.

- Future Child Resident (mixed soil): carcinogenic risk number of 2E-05/ noncarcinogenic HI of <1.
- Future Adult + Child Resident (mixed soil): carcinogenic risk number of 4E-05.

Building 1437

- Future Adult Resident (subsurface soil): noncarcinogenic HI of <1.
- Future Child Resident (subsurface soil): noncarcinogenic HI of <1.

3.40.4.2 *Ecological*

Site 200, Former Building 1030

Elevated arsenic levels (maximum 62.6 mg/kg) were found in soil/sediment to the northeast of Building 1030 and near Robinson Run. Due to the potential for exposure of aquatic organisms to contaminants from the acid tank farm, the potential for exposure of terrestrial organisms to the elevated arsenic levels in soil or sediment, this area was evaluated as part of the Area L ecological risk investigation. Food chain modeling results for Area L indicated limited potential risks, however, field studies showed no evidence of impact on local populations. Based on the overall weight of evidence, it was concluded that there were no significant effects on the local ecological populations.

Site 200, Former Building 1037

All metals and explosives detected in soil samples from the area surrounding Building 1037 were at low levels, well below their SC. Sufficient habitat exists in the vicinity of Building 1037 that could be used by wildlife. However, concentrations measured in soil are relatively low and combined with the small size of the site do not pose a significant threat to ecological receptors. Therefore, no ERA was recommended for terrestrial exposures. A small trench beneath the building drained to a small ditch that eventually discharged to Robinson Run. Potential risks associated with this ditch were evaluated as part of Robinson Run. Based on the multimetric approach (New Jersey Impairment Score [NJIS]) benthic communities in Robinson Run were determined to not be at significant risk. Based on these data, ecological risks associated with Building 1037 were determined to be minimal.

Site 200, Former Building 1038

Soil samples were collected below the tanks and manifold gutter and adjacent to the solvent pumps on the west side of the tank area in order to address any potential contamination from spills or leaks. No exceedances were reported. Though the wooded and shrubby habitat in the vicinity of the solvent storage facility is suitable for wildlife, no significant exposure to contaminants is expected. Groundwater exposures are unlikely and soil did not contain elevated levels of contaminants; therefore, no ERA was recommended for Building 1038.

Site 200, Former Building 1090

Though there is wooded and shrubby habitat in the vicinity of Building 1090 that is suitable for wildlife, no significant exposure to contaminants is expected. Groundwater exposures are unlikely and soil did not contain elevated levels of contaminants. No ERA is recommended for Building 1090.

Site 200, Former Building 1414

Soil samples were collected in areas where there were potential releases from the building, spills during transport into or out of the building, and releases from outdoor process areas. Lead was found elevated in one sample (1090 mg/kg) and arsenic was found slightly elevated in another sample (22.2 mg/kg) during the preliminary assessment/site investigation in 1996. Explosives were not detected above their reporting limits. Subsequent sampling during the Phase III 2A/3A investigations to delineate the arsenic and lead contamination did not find any elevated levels. The lead and arsenic exceedances identified earlier are suspected to have been relocated or removed during the subsequent demolition of Building 1414 and the regrading of the area. Since no contamination was found in the soils in relation to Building 1414, no ERA is recommended for this site.

Site 200, Former Building 1414A

Soil samples were collected near the building and in the surface water drainage near the storm runoff discharge point. Several PAHs were detected in the surface water drainage feature, but at relatively low levels. Though wooded and shrubby habitat exists near Former Building 1414A, significant exposure by wildlife is unlikely due to the low levels of PAHs detected. Therefore, no ERA was recommended.

Site 200, Former Building 1415

Soil samples were collected in areas where there were potential releases from the building and spills during transport into or out of the building. The only explosive detected was nitrocellulose at a concentration of 790 mg/kg. There is no SC for nitrocellulose; however, it has been evaluated to have little toxicity for most aquatic species and is virtually non-toxic to humans and mammals. Since no contamination was found in the soils in relation to Building 1415, no ERA was recommended for this site.

Site 200, Former Building 1437

During the PA/SI, one sample collected beneath the trough system on the north side of Building 1437 contained a lead concentration of 5,030 mg/kg. Subsequent sampling during the Phase III 2A/3A investigations found no evidence of lead contamination present at the site and no explosives were detected above their reporting limits. Due to the lack of contamination in the soil at Building 1437, no ERA is warranted.

*3.40.4.3 Lead Blood Models*

The lead blood model was not calculated as part of the 2005 RI Report as lead was not identified as a COPC at any of the above sites.

*3.40.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is less than the generally acceptable risk range of 1E-04 to 1E-06;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- Ecological risks are not a concern at this site.

For the hypothetical residential use risk scenarios evaluated, risks are within the generally acceptable risk range of 1E-06 to 1E-04, and the HI is less than 1 for

Buildings 1030, 1037, 1414, 1414A, and 1415, and 1437. Hypothetical residential use risk scenarios were not evaluated at the remaining buildings, 1038 and 1090.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios were not conducted at all of the buildings and some contaminants are present at concentrations that exceed residential criteria, this site cannot be released for unrestricted use.

### **3.41 PICA-209/Site 209 –Building 167, Locomotive Area, Building 430**

#### 3.41.1 Site History

PICA-209/Site 209 DSERTS is composed of five individual buildings within Area F, including Buildings 167, 303, 426, 430, and 462A. The buildings of Site 209 are shown on Figures 3-90, 3-92, 3-94, 3-96, and 3-98.

#### Building 167, Explosives and Radiochemistry Laboratory

Constructed in 1930, Building 167 is located along Kibler Road in the southern portion of Area F and was used as a High Explosives Preparation and Testing Laboratory. After the 1950s, the building was used as a nuclear-chemical test research facility. Hazardous materials stored and used in this laboratory included Class 7 explosives, flammable solvents (acetone, methyl ethyl ketone, toluene), and uranyl sulfate. The installation's Health Physics Office (HPO) files indicate that the facility was also used as a radiochemistry laboratory. In September 1962, radiation levels in the building were greater than allowable for an unrestricted area due to radioactive waste storage in the building. A follow-up survey by the Radiation Protection/Safety Officer found high levels in only one sink containing a yellow powder suspected to be uranyl sulfate.

Before 1951, no system was in place to remove liquid laboratory waste; it is assumed that such waste may have been hand-carried out of the building. After 1951, all liquid wastes from sinks and floor drains were discharged into holding tanks in the concrete-lined basement. A September 1982 Disposition Form in the HPO states that once the contaminated sink was remediated or removed, the building was cleared for use. Dye testing of the funnel drain that was used for steam collection showed leaks in the basement walls during a 1991 wastewater survey (Foster Wheeler 1991). In December 2001, the HPO conducted a final release survey and removal action of the Building 167 interior and the fenced area adjacent to the building to demonstrate that the areas met

the Nuclear Regulatory Committee's (NRC) established release criteria for unrestricted use following the remediation. Building 167 was last known to be vacant.

Picatinny's HPO files also indicate that Building 167 temporarily stored hazardous and radioactive waste in an outdoor storage area (OSA) west of Kibler Road. The OSA was at least 5 ft wide and 10 ft long, and was last surrounded by a chain link fence. Buildings 163, 166, and 197 contained laboratory operations that potentially contributed waste to the OSA. Waste contribution quantities from nearby former operations are not known.

#### Former Building 303, Locomotive House

Former Building 303 was located along 14<sup>th</sup> Avenue in the northern portion of Area F and was used as the locomotive house prior to the Lake Denmark explosion on July 10, 1926. The building was located approximately 90 ft northwest of Building 472. Only the concrete floor, three rolling stock abutments, some track fragments, and some brick wall fragments remained. The floor contained two pits that reportedly drained wastewater and spent petroleum products into the subsurface soil. One floor pit was filled with cinders. In 1929, a new locomotive house (Building 507) was constructed in Area I.

#### Former Building 426, Mixing Laboratory

Building 426 was located east of 13th Avenue in the northern portion of Area F and was used as a mixing house prior to its destruction during an explosion in 1945. Based on a review of old facility maps, it appears that Building 427A and former Building 427C are situated on the foundation of former Building 426. No other information is available concerning this building.

#### Building 430, Propellant Systems Facility

Building 430, located east of 13<sup>th</sup> Avenue, was a former Propellant Systems Facility. The building was constructed in 1922 and originally used to produce and test small batches of nitroglycerine. In the 1940s, the facility was used as an experimental powder finishing house and contained a drying room, sifter, mixer, Throop rolls, and an extrusion mill. During the 1950s, the building was converted to a propellant process laboratory until site operations were discontinued in 1986. Liquid wastes were retained in three 15-gallon lead catch tanks installed in the 1950s. One tank was located in the basement, and two are located on the south side of the building. Overflow pipes for the

outside tanks discharged directly onto the soil surface. The basement lead catch tank received wastewater from the primary sink, and its overflow pipe or pipes discharged into a nearby intermediate drainage ditch. Floor and laboratory wash/decontamination water may have flowed into a gutter that discharged out of an open spout at the northeast corner of Building 430.

A RCRA Closure Action in November 1995 removed the basement tank, associated troughs, and plumbing. The analytical results of soil samples collected along the discharge pipe's path indicated only traces of explosives and high lead concentrations. No samples were collected from the former tanks overflow discharge pipe outfall or from the intermediate drainage ditch. Building 430A is not currently being used, but was scheduled for renovation in 2005. It is unknown whether the renovations were completed.

#### Building 462A, General Purpose Magazine

Building 462A, a General Purpose Magazine, is located in the northern portion of Area F along 14<sup>th</sup> Avenue, approximately 760 ft east of GPB. Building 462A, built in 1941, was used for storage of explosives as part of the neutralizing house for the guncotton line. According to site plans from 1940, Building 462A contained a concrete sump that is believed to have received wastewater from Building 462. The water was then discharged into a ditch located southwest of the building.

There are currently no plans for future construction at PICA-209/Site 209.

#### 3.41.2 Previous Investigations

A PA/SI was conducted in 1994 that included the Building 167, 430, and 462A areas. The PA/SI concluded that there was potential for the presence of impacted soils and/or sediments at all three building areas.

During the USACHPPM investigation at Building 462A, groundwater sampling was attempted via Geoprobe, but was unsuccessful due to borehole concentrations of gasses greater than the lower explosive limit (LEL). During the drilling attempts, discolored soil was encountered. One wastewater sample and one sludge sample were collected from the neutralizing sump for analysis of VOCs, SVOCs, metals, and explosives.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

Subsequent to the USACHPPM investigation, a groundwater study of Areas F and G was conducted in 1998 (IT). This study included the installation and sampling of monitoring wells at several sites within Areas F and G. Monitoring well 104MW-1 was installed at Site 104, which is located adjacent and hydraulically cross-gradient to Building 167.

New World Technology (NWT) conducted a radiological release survey in and around Building 167, and an interim removal action and confirmatory soil sampling at the OSA at Building 167 in October and November 2001 and June 2002.

Sampling activities for the Phase I 2A/3A RI were conducted at Building 167 from September 2000 through April 2000. Twelve surface soil samples were collected during the investigation. Surface soil samples B167SS-6A through B167SS-8A, B167SS-14A through B167SS-16A, and B167SS-17B were analyzed for PAHs. Surface soil samples B167SS10-A through B167SS-13A were analyzed for metals. Surface soil sample B167SS-9A was analyzed for VOCs, pesticides, PCBs, metals, baseline explosives, PETN, nitroglycerine, nitroguanidine, nitrocellulose, and at a later date in the investigation, radiological constituents. Four groundwater samples (104MW-1, MW167-1, MW167-2, MW167-3) were collected and analyzed for VOCs, metals, baseline explosives, PETN, nitroglycerine, nitroguanidine, and nitrocellulose. A surface gamma radiation scan survey was conducted and one additional surface soil sample (B167SS-9A, adjacent to original surface soil sample location PICA-167-3S) was collected for radiological constituents at Building 167 in the area between Buildings 166 and 167, adjacent to the former OSA.

Sampling activities for the Phase I 2A/3A RI were conducted at Building 303 from September 2000 through June 2001. Four surface soil samples (FAR-1SA, FAR-2SA, FAR-2SB, and FAR-3SA) and two subsurface soil samples (FAR-1SC and FAR-3SC) were collected and analyzed for PAHs, arsenic, and lead. Two surface soil samples (FB303SB-1A and FB303SB-2A) and four subsurface soil samples (FB202SB-1B, FB303SB-1C, FB303SB-2B, and FB303SB-2C) were collected and analyzed for VOCs, SVOCs, and metals. Three surface soil samples (FB303SB-3A, FB303SB-4A, and FB303SB-5A) and three subsurface soil samples (FB303SB-3B, FB303SB-4B, and FB303SB-5B) were collected and sampled for arsenic and lead. One new groundwater monitoring well was installed, surveyed, and sampled; two hydropunch groundwater samples were collected; and one existing groundwater monitoring well was sampled during the investigation. Groundwater samples were analyzed for VOCs, SVOCs, and metals.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

No studies were conducted at Building 426 prior to the Phase I 2A/3A RI sampling activities, which were completed in November 2000. Four surface soil samples (B246SB-1A through -4A) and four subsurface soil samples (B426SB-1B through -4B) were collected from four soil borings during the investigation. Samples were analyzed for metals, baseline explosives, PETN, nitroglycerine, nitroguanidine, and nitrocellulose.

Sampling activities for the Phase I 2A/3A RI were conducted at Building 430 from September 2000 through December 2001. Seven surface soil samples (B430SS-5A through -11A) and two subsurface soil samples (B430SS-8C and B430SS-9C) were collected and analyzed for arsenic and lead. Six surface soil samples (B430SS-18A through -22A and B430SS-23) and two subsurface soil samples (B430SB-2B and B430SB-3B) were collected and analyzed for lead only. Two surface soil samples (B430SS-24 and B430SS-25) were collected and analyzed for lead and explosives. One subsurface soil sample, B430SB-1B, was collected and analyzed for metals, baseline explosives, PETN, nitroglycerin, nitrocellulose, and nitroguanidine. Three sediment samples (B430SD-12A, -13A, and -14A) were sampled and collected for arsenic, lead, baseline explosives, PETN, nitroglycerin, nitrocellulose, and nitroguanidine. Two vertical delineation sediment samples (B430SD-12C and B430SD-13C) and three horizontal delineation sediment samples (B430SD-15A, -16A, and 17A) were collected and analyzed for lead, baseline explosives, PETN, nitroglycerin, nitrocellulose, and nitroguanidine. One groundwater piezometer was installed and sampled for metals, baseline explosives, and nitrocellulose. Two groundwater monitoring wells, MW430-B and PW-430-A were also sampled for RDX and metals.

Sampling activities for the Phase I 2A/3A RI were conducted at Building 462A from September 2000 through December 2003. One surface soil sample (B462ATP-1A) and one subsurface soil sample (B462ATP-1B) were collected from a test pit and analyzed for baseline explosives, PETN, nitroglycerine, nitrocellulose, and nitroguanidine. One subsurface soil sample (B462A-MW-1B) was collected and analyzed for VOCs, SVOCs, metals, baseline explosives, PETN, nitroglycerine, nitrocellulose, and nitroguanidine. Three surface water samples (B462ASW-1, -2, and -5) and five sediment samples (B462ASD-1 through -5) were collected and analyzed for SVOCs, metals, baseline explosives, PETN, nitroglycerine, nitrocellulose, and nitroguanidine. One new groundwater monitoring well was installed, surveyed and sampled for VOCs, SVOCs, metals, baseline explosives, PETN, nitroglycerine, nitrocellulose, and nitroguanidine.

A removal action was conducted in the Building 462A area as part of the Facility-Wide Dump and Dry well Investigation in December 2003. A hexagon-shaped sump, sampled at B462SD-4, was excavated to a depth of 4 ft bgs. Approximately 1 cubic yard of soil was removed in addition to the sump itself. One sidewall and one bottom soil sample were collected and analyzed for SVOCs, metals, baseline explosives and NC.

Investigation of the open concrete drain gutter at Building 430 was conducted in June 2004 by Shaw as part of the Facility-Wide Sump and Dry Well Removal Investigation. Three surface soil samples (430TR-1, 430TR-2, and 430TR-3) were collected from locations within/under the concrete gutter. Samples were analyzed for metals and baseline explosives.

A removal action was conducted in the area of sample location B167SS-7A between August and September 2004 to address the PAH concentrations identified during the RI field investigation. The excavation was completed to a depth of 2.0 ft bgs and approximately 4 cubic yards of soil were removed from the excavation. Three post-excavation samples were collected from the sidewall and bottom of the excavation and analyzed for PAHs.

A removal action was conducted west of Building 303 in June 2004 to address the lead concentrations identified in soil during the 2000 RI sampling. Two excavations were completed to depths of 7.0 to 7.5 ft bgs. Approximately 54 cubic yard of soil were removed from the excavations and transported to the 3500 Area where it was used to increase the existing grade for building construction in that area. A total of ten post-excavation samples were collected from the sidewalls and bottoms of each excavation and were analyzed for SVOCs, arsenic, and lead.

#### 3.41.3 Nature and Extent of Contamination

Data available from the Picatinny Database are included in Appendix A.

#### Building 167, Explosives and Radiochemistry Laboratory

Figure 3-91 shows the locations associated with Building 167, and concentrations where one or more constituent exceeded an SC.

Three radiation anomalies were found near the OSA at Building 167. Two of the anomalies were detected at the downspouts of the rain gutters. This area was

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

impacted with Barium-133. Based on the results of the radiological survey, contaminated soils from the radioactive waste storage area were removed. Following the removal of contaminated soil, the storage area was divided into six grids and a 100% gamma surface scan survey was performed to determine if further soil removal was required. One post-excavation sample was collected from each of the six grids (for a total of six samples) and analyzed for barium-133. Barium-133 concentrations ranged from 0.127 picocuries per gram (pCi/g) to 6.0 pCi/g. Based on the analytical results, no further soil removal was required.

In surface soils, samples F-B167-SS-6, F-B167-SS-7, F-B167-SS-8, F-B167-SS-14, and F-B167-SS-17 contained benzo(a)pyrene at concentrations greater than the SC (0.2 mg/kg), ranging from 0.24 mg/kg to 7.1 mg/kg. Surface soil sample F-B167-SS-7 also contained benz(a)anthracene (SC = 2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2,3-cd)pyrene (SC = 2 mg/kg) at concentrations that exceed SC: at 7 D mg/kg, 14 D mg/kg, 1.4 JD mg/kg, and 6 D mg/kg, respectively. Additionally, a removal action was conducted in the area of sample location F-B167-SS-7A, and no PAHs were identified above soil criteria in the excavation bottom sample at that time. However, sidewall samples (F-EX167-SWW-1 and F-EX167-SWW-2) and one bottom sample (F-EX167-B-1) exceed the current SC (0.2 mg/kg) for benzo(a)pyrene at concentrations of 0.87 D mg/kg, 0.48 JD mg/kg, and 0.4 mg/kg, respectively. No other constituents exceeded SC in surface soils.

In groundwater, sodium (SC = 50,000 ug/L) and TCE (SC = 1 ug/L) were detected in two wells, F-MW167-3 and F-104-MW-1, at concentrations greater than SC. Sodium concentrations in the wells ranged from 89,900 ug/L to 101,000 ug/L. TCE concentrations in the wells ranged from 5.5 ug/L to 6.4 ug/L. F-MW167-3 also contained manganese (SC = 50 ug/L) and PCE (SC = 1 ug/L) at concentrations of 1,100 ug/L and 2.9 ug/L, respectively. Monitoring wells F-MW167-1 and F-MW167-2 contained aluminum (SC = 200 ug/L) at concentrations of 1,100 J ug/L and 450 J ug/L, respectively. Monitoring well F-MW167-1 also contained manganese at a concentration of 560 ug/L, which is greater than the SC = 50 ug/L. The constituents TCE, PCE, RDX, silver, and sodium may have been used in the laboratory operations at Building 167, however, there is no existing source for these constituents. Hazardous materials stored and used in and around the building included explosives and solvents. The absence of these compounds in the groundwater samples collected from the upgradient wells 167-1 and 167-2 further support the contention that Building 167 was a possible source of the groundwater contamination. However, VOCs, explosives, and metals have been reported in excess of SC on an area-wide basis. VOCs and explosives identified in

monitoring wells located in the Building 167 area are currently being addressed as part of the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### Former Building 303, Locomotive House

Figure 3-93 shows the locations associated with Former Building 303, and concentrations where one or more constituent exceeded an SC.

In surface soils, benzo(a)pyrene was detected at concentrations exceeding the SC (0.2 mg/kg) at sample locations F-FAR-2S (1.3 mg/kg), F-FAR-3S (0.47 mg/kg), and F-FB303-SB-2 (0.37 J mg/kg). One other PAH was also identified at a concentration greater than the SC (0.2 mg/kg): 0.24 J mg/kg dibenz(a,h)anthracene at sample location F-FAR-2S. No other constituents exceeded SC in surface soils.

In subsurface soils, benzo(a)pyrene (SC = 0.2 mg/kg), arsenic (SC = 19 mg/kg), and lead (SC = 800 mg/kg) were the only constituents detected with concentrations exceeding SC. Benzo(a)pyrene exceeded the SC at sample locations F-303-S1-B-1, F-B303-EX2-B-1, F-B303-EX2-SWE-1, F-B303-EX2-SWW-1, F-FAR-3S, and F-FB303-SB-2 with concentrations ranging from 0.25 mg/kg to 1.2 mg/kg. Arsenic exceeded the SC at sample locations F-303-S2-B-1, F-B303-EX2-SWE-1, F-B303-EX2-SWS-1, F-FAR-3S, and F-FB303-SB-5 with concentrations ranging from 20.4 mg/kg to 117 mg/kg. Lead exceeded the SC at sample location F-FAR-3S with a concentration of 1440 J mg/kg. No other constituents exceeded SC in subsurface soil.

In groundwater, naturally occurring metals were the primary constituents that exceeded SC, however, one SVOC, bis(2-ethylhexyl)phthalate (SC = 3 ug/L), exceeded the SC with a concentration of 6.3 J ug/L in hydropunch sample F-FB303HP-2. Hydropunch samples F-FB303HP-1 and F-FB303HP-2 both exceeded SC for aluminum (SC = 200 ug/L), iron (SC = 300 ug/L), and manganese (SC = 50 ug/L) with respective concentrations of 7500 ug/L and 3600 ug/L for aluminum, 8900 ug/L and 4500 ug/L for iron, and 280 ug/L and 110 ug/L for manganese. Hydropunch sample F-FB303HP-1 also exceeded the lead SC (5 ug/L) with a concentration of 5.2 ug/L. No other constituents exceeded SC in groundwater. Groundwater at this site is located within the Mid-Valley area and will be further discussed within the Mid-Valley Groundwater FS (ARCADIS 2009b).

#### Former Building 426, Mixing Laboratory

The analytical results from Phase I 2A/3A sampling activities conducted at former Building 426 in November 2000 indicated that no compounds were detected in surface or subsurface soil exceeding SC. Analytical data associated with Building 426 was compared to the NJDEP Residential SRS and the USEPA RSLs. The maximum concentration of arsenic (7.3 J mg/kg) was less than the SRS value, but exceeded the residential carcinogenic RSL; however, concentrations of arsenic from all samples associated with Building 426 were less than the Picatinny background concentrations of arsenic (9.23 mg/kg). Based on the results of the investigation, it does not appear that the soil surrounding former Building 426 was impacted by the explosion that occurred in 1945 or by the past operations that were conducted at Building 426. Historical sample locations are presented on Figure 3-95.

#### Building 430, Propellant Systems Facility

Figure 3-97 shows the locations associated with Building 430, and concentrations where one or more constituent exceeded an SC.

In surface soils, only 2,4-DNT (SC = 4.2 mg/kg), 2,6-DNT (SC = 4.2 mg/kg), and lead (SC = 800 mg/kg) were detected at concentrations greater than the SC. The explosive 2,4-DNT exceeded the SC at sample locations F-B430TR-1, F-B430-SS-12, -13, -14, and F-B430DC-1 with respective concentrations of 5.6 mg/kg, 16 mg/kg, 65 D mg/kg, 67 D mg/kg, and 7.2 D mg/kg. Another explosive, 2,6-DNT exceeded its SC at sample locations F-B430-SS-13 and F-B430-SS-14 with concentrations of 5.9 mg/kg and 5.2 mg/kg, respectively. Lead exceeded the SC at sample locations F-B430-SS-6, F-B430-SS-8, F-B430-SS-9, F-B430-SS-10, F-B430-SS-12, F-B430-SS-13, F-B430-SS-23, and F-B430-SS-24 with concentrations ranging from 266 J mg/kg to 2,330 J mg/kg. No other constituents exceeded SC in surface soil.

In subsurface soils, only two constituents exceeded SC: lead (SC = 800 mg/kg) in sample F-B430-SS-9 with a concentration of 998 J mg/kg, and arsenic (SC = 19 mg/kg) in sample F-B430-SS-08 with a concentration of 21.2 J mg/kg.

In sediment samples F-B430-SD-12, -13, -15, -16, and -17 contained 2,4-DNT (SC = 4.2 mg/kg) at concentrations ranging from 7.6 mg/kg to 870 mg/kg. Samples F-B430-SD-13 and -15 contained 2,6-DNT (SC = 4.2 mg/kg) at concentrations 13D mg/kg and 62 mg/kg, respectively, which are greater than the SC. Sediment samples F-B430-SD-12, -13, 15, -16, and -17 contained lead at concentrations exceeding the SC (38.8 mg/kg) ranging from 96.3 mg/kg to 998 J mg/kg. No other constituents were detected with concentrations greater than the SC in sediment.

During the Phase I 2A/3A RI at Building 430, the piezometer groundwater sample B430PZ-1 contained aluminum (SC = 200 ug/L), arsenic (SC = 3 ug/L), iron (SC = 300 ug/L), lead (SC = 5 ug/L), and manganese (SC = 50 ug/L) at concentrations of 3,000 ug/L, 5.6 ug/L, 9,000 ug/L, 32 ug/L, and 690 J ug/L, respectively, which are greater than SC.

#### Building 462A, General Purpose Magazine

Figure 3-99 shows the locations associated with Building 462A, and concentrations where one or more constituent exceeded an SC.

In surface soil, analytical results of the sidewall and bottom excavation samples from the hexagon-shaped sump removal at Building 462A indicate the presence of benzo(a)pyrene (SC = 0.2 mg/kg) in soil in the eastern sidewall sample (462A-SS-HEX-SWE-1) and two bottom samples (462A-SS-HEX-B1 and -B2) at concentrations ranging from 0.21 J mg/kg to 0.94 mg/kg. Arsenic (SC = 19 mg/kg) was also detected in bottom sample 462A-SS-HEX-B1 at a concentration of 28.2 mg/kg. No other constituents exceeded SC in soil.

In sediment, sediment samples B462-SD1 through -SD5 all contain constituents at concentrations greater than SC. Sediment sample B462-SD1 contained 2,4-DNT (SC = 4.2 mg/kg) at a concentration of 13 D mg/kg and 12 mg/kg (analyzed via two different methods), copper (SC = 28 mg/kg) at a concentration of 83.2 J mg/kg, di-n-butylphthalate (SC = 11 mg/kg) at a concentration of 26 D mg/kg, mercury (SC = 0.249 mg/kg) at a concentration of 0.26 J mg/kg, and nickel (SC = 39.6 mg/kg) at a concentration of 126 J mg/kg. Sediment sample B462SD-2 contained 2,4-DNT at concentrations of 14 D mg/kg and 36 JD mg/kg (analyzed via two different methods), copper at a concentration of 72.2 J mg/kg, mercury at a concentration of 2.1 J mg/kg, nickel at a concentration of 40.4 J mg/kg, and 17 different PAHs at concentrations all greater than their respective SC. Sediment sample B462SD-3 contained mercury at a concentration of 0.46 J mg/kg, zinc (SC = 171 mg/kg) at a concentration of 335 J mg/kg, and 12 different PAHs at concentrations all greater than their respective SC. Sediment sample B462SD-4 contained 2,4-DNT at concentrations of 34 D mg/kg and 81 mg/kg (analyzed via two different methods), arsenic (SC = 16 mg/kg) at a concentration of 21.1 JD mg/kg, cadmium (SC = 1.7 mg/kg) at a concentration of 3.9 JD mg/kg, chromium (SC = 37.3 mg/kg) at a concentration of 63.4 JD mg/kg, copper at a concentration of 240 J mg/kg, manganese (SC = 1,673 mg/kg) at a concentration of 1,920 JD mg/kg, mercury at a concentration of 1.4 J mg/kg, zinc at a concentration of 513 JD mg/kg, and 12 PAHs all at concentrations greater than their respective SC.

Sediment sample B462SD-5 contained 2,4-DNT and 2,6-DNT at concentrations ranging from 6.4 mg/kg to 67 mg/kg (analyzed via two different methods), di-n-butylphthalate (SC = 11 mg/kg) at a concentration of 94 mg/kg, arsenic at a concentration of 17.8 J mg/kg, copper at a concentration of 70.9 J mg/kg, mercury at a concentration of 1.8 J mg/kg, nickel at a concentration of 67.9 J mg/kg, and zinc at a concentration of 186 J mg/kg, which are all greater than respective SC. No other constituents exceeded SC in sediment.

Surface water sample B462SW-1 contained the metals aluminum (SC = 190 ug/L), arsenic (SC = 1.38 ug/L), cadmium (0.28 ug/L), copper (SC = 9.4 ug/L), iron (SC = 1,790 ug/L), lead (SC = 3.2 ug/L), manganese (SC = 383 ug/L), and zinc (SC = 122 ug/L) at concentrations of 410 ug/L, 41 ug/L, 0.59 J ug/L, 13 J ug/L, 22,800 ug/L, 19 ug/L, 1,700 ug/L, and 130 ug/L, respectively. Surface water sample B462SW-2 contained 2,4-DNT (SC = 0.11 ug/L) at a concentration of 3.3 J ug/L, aluminum, arsenic, cadmium, chromium, copper, iron, lead, manganese, mercury, nickel (SC = 52 ug/L), selenium (SC = 5 ug/L), and zinc at concentrations of 8,400 ug/L, 6.4 ug/L, 1.2 J ug/L, 17 J ug/L, 100 J ug/L, 11,300 ug/L, 390 ug/L, 740 ug/L, 1.5 ug/L, 57 ug/L, 5.5 ug/L, and 250 ug/L respectively. Surface water sample B462SW-5 contained aluminum and lead at concentrations of 270 ug/L and 8.3 ug/L. No other constituents exceeded SC in surface water. There were no exceedances of SC in groundwater. Ground water at this site is located within the Mid-Valley area and will be discussed as part of the Mid-Valley FS.

#### 3.41.4 Summary of Risk Assessments

##### 3.41.4.1 Human Health

An HHRA was completed in 2005 for PICA-209 receptors in the Phase I 2A/3A RI Report. The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPAs generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk at PICA-209 are summarized in Table 3-1.

Current human health risks under reasonably anticipated future use scenarios are:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

### Building 167

- Current and Future Industrial/Research Worker: carcinogenic risk number of 4E-05/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 5E-08/ noncarcinogenic HI of <1.

### Building 303

- Current and Future Industrial/Research Worker: carcinogenic risk number of 7E-05/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 1E-05/ noncarcinogenic HI of 1.

### Building 426

- Current and Future Industrial/Research Worker: carcinogenic risk number of 1E-05/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 5E-07/ noncarcinogenic HI of <1.

### Building 430

- Current and Future Industrial/Research Worker: carcinogenic risk number of 1E-05/ noncarcinogenic HI of <1.
- Current and Future Construction/Excavation Worker: carcinogenic risk number of 2E-06/ noncarcinogenic HI of <1.

### Building 462A

- Current and Future Construction/Excavation Worker: carcinogenic risk number of 5E-10/ noncarcinogenic HI of <1.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

### Building 167

- Future Adult Resident (soil): carcinogenic risk number of  $9E-04$ / noncarcinogenic HI of  $<1$ .
- Future Child Resident (soil): carcinogenic risk number of  $5E-04$ / noncarcinogenic HI of 3.

### Building 303

- Future Adult Resident (mixed soil): carcinogenic risk number of  $2E-04$ / noncarcinogenic HI of  $<1$ .
- Future Child Resident (mixed soil): carcinogenic risk number of  $1E-04$ / noncarcinogenic HI of 2.

### Building 426

- Future Adult Resident (mixed soil): carcinogenic risk number of  $2E-05$ / noncarcinogenic HI of  $<1$ .
- Future Child Resident (mixed soil): carcinogenic risk number of  $2E-05$ / noncarcinogenic HI of  $<1$ .

### Building 430

- Future Adult Resident (mixed soil): carcinogenic risk number of  $4E-05$ / noncarcinogenic HI of  $<1$ .
- Future Child Resident (subsurface soil): carcinogenic risk number of  $3E-05$ / noncarcinogenic HI of 2.

### Building 462A

- Current and Future On-site Youth Visitor (sediment): carcinogenic risk number of  $6E-05$ /noncarcinogenic HI of  $<1$ .
- Future Adult Resident (sediment): carcinogenic risk number of  $9E-04$ / noncarcinogenic HI of 2.

- Future Child Resident (sediment): carcinogenic risk number of 5E-04/ noncarcinogenic HI of 10.

#### *3.41.4.2 Lead Blood Model Results*

The lead blood model was calculated in 2005 for the buildings where lead was identified as a potential concern as part of the Site 209 RI. The only buildings associated are 303 and 430.

#### Building 303

The current and reasonably anticipated future use scenarios were reevaluated at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 984 mg/kg, less than the calculated PRG of 1,092 mg/kg.
- Current Construction Worker (subsurface soil): No concern- average lead concentration of 371 mg/kg, less than the calculated PRG of 1,092 mg/kg.

Additionally, human health risks associated with lead exposures were calculated for use scenarios not reasonably anticipated and are as follows:

- Current Adult Resident (mixed surface and subsurface soil): No concern - average lead concentration is 739 mg/kg, which is less than the calculated PRG or 1,092 mg/kg.

#### Building 430

The current and reasonably anticipated future use scenarios were reevaluated at this site to reflect current guidance for model input parameters as detailed in Appendix C, and the PRG revised accordingly. The following results were reported:

- Current Industrial/Research Worker (surface soil): No concern - average lead concentration of 965 mg/kg, less than the calculated PRG of 1,092 mg/kg.
- Current Construction Worker (subsurface soil): No concern - average lead concentration of 398 mg/kg, less than the calculated PRG of 1,092 mg/kg.

Additionally, human health risks associated with lead exposures were calculated for use scenarios not reasonably anticipated and are as follows:

- Current On-site Youth Visitor (sediment): No concern -average lead concentration of 556 mg/kg, less than the calculated PRG of 1,092 mg/kg.
- Current Adult Resident (mixed surface and subsurface soil): The average lead concentration is 776 mg/kg, which is less than the calculated PRG or 1,092 mg/kg.
- Current Adult Resident (sediment): The average lead concentration is 556 mg/kg, which is less than the calculated PRG or 1,092 mg/kg.

#### *3.41.4.3 Ecological*

##### Site 209, Building 167, Explosives and Radiochemistry Lab

Building 167 is located along Kibler Road, which is a high-use area within the valley portion of Picatinny. The high level of human activity and the small size of the site (0.1 acre) would discourage most ecological receptors, even those adapted to an urban environment. As a result, ecological exposures are expected to be extremely limited and no further ecological evaluation is required.

##### Site 209, Former Building 426, Mixing Lab

No ERA was conducted at Site 209, former Building 426, because ecological exposures are expected to be extremely limited. The site is located within a high-use, highly industrialized area of Picatinny that consists mainly of former building foundations. The area provides very little shelter or suitable habitat. In addition, the high level of activity in this area would dissuade most species, even those adapted to urban areas. Therefore, ecological exposures are expected to be minimal.

##### Site 209, Building 462A

No ERA has been performed at Site 209, Building 462A. This wooded area provides excellent habitat for most terrestrial species. Although there is surface water and sediment at the site, the intermittent nature of the drainage ditch does not provide suitable habitat for aquatic species as noted in the Phase II ERA (IT 2000). As part of the Phase II ERA, three surface soil bioassays were conducted on samples collected from the ditch downgradient of Building 462A because of elevated metals and

explosives concentrations. Results of the bioassays indicated that the levels of metals and explosives in the ditch were not toxic to earthworms. Although DNT and several metals were detected in the earthworm tissue, there was no apparent effect on the survival of the earthworms. Additionally the removal of sediment from the sumps eliminated the potential exposure pathway and no ERA was recommended in the 2005 SLERA report.

#### Site 209, Building 430

The former Propellant Systems Facility was constructed in 1922 and was originally used to produce and test small batches of nitroglycerin. While the site is very small (0.25 acres), the surrounding area is wooded and provides good habitat for terrestrial species. Some discharges from Building 430 were to a nearby intermittent drainage ditch. The intermittent nature of the drainage ditch does not provide suitable habitat for aquatic species on-site, although it may provide a mechanism for contaminant migration to GPB; potential impacts to that water body have been evaluated separately. In 2004, lead contaminated soil at Building 430 was removed as part of a facility-wide lead removal action. Surface soil behind Building 430 was removed and replaced with clean soil, effectively eliminating most terrestrial ecological exposures at the site. As a result, it is assumed that ecological exposures at the site are minimal.

#### Site 209, Building 303, Locomotive House

Building 303 is located in a very developed, highly industrialized area of the Installation, consisting mainly of building foundations and railroad tracks. The highly urbanized nature of the site would discourage most ecological receptors, even those adapted to an urban environment. As a result, ecological exposures are expected to be extremely limited and no further ecological evaluation is required.

#### *3.41.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use (military/industrial):

- The carcinogenic risk is less than the generally acceptable risk range of 1E-04 to 1E-06;
- The noncarcinogenic hazard is less than the threshold of 1;

- Lead is not a concern at this site; and
- Ecological risks are not a concern at this site.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios were not conducted at all of the buildings and some contaminants are present at concentrations that exceed residential criteria, this site cannot be released for unrestricted use.

### **3.42 PICA-008/Site 1 – Naval Air Rocket Test Station, Test Area G**

#### 3.42.1 Site History

Site 1 was operated by the NARTS division of the Navy under a lease agreement with the Department of the Army from the early-1950s until the late-1960s. NARTS rocket damage control test activities began at Site 1 in 1953. Picatinny site maps and a NARTS public document describing facility operations indicate that, as of 1960, Site 1 included over 25 buildings and supporting structures and was known as the G-1 (Buildings 3553-3556) and G-2 (Buildings 3558-3594) Test Areas. The majority of the structures at this site were decontaminated and demolished prior to 1986. Site 1 is currently inactive and contains rubble and debris from past demolition activities. Many of what are referred to as “buildings” within Site 1 are actually test turrets, metal frames, or concrete test pads.

As reported in the Phase II Group 3 Sites RI, conflicting information exists regarding the initial uses of Site 1. According to the 1991 ANL RI Concept Plan (ANL 1991), the site was originally developed around 1940 for residential use. Aerial photos and interviews with Picatinny personnel, however, suggest that the G-1 and G-2 Test Areas were unimproved woodlands before test structures were constructed around 1953. Shock sensitivity testing of rocket propellants was performed in the G-1 Test Area, and was generally performed on a target pad (Building 3555) using a portable shock tester. A grate-covered trough, located at the southern end of the target pad, collected wash down waters from test activities. No building-specific drawings exist at Picatinny to determine where the trough discharged.

Three concrete pads, Buildings 3590, 3591, and 3594 were used for performing damage control testing of rocket propellant cylinders. The cylinders contained amine, hydrazine and petroleum-based fuels and an oxidizer. The amine-based fuels were

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

detonated in open pans. Picatinny personnel reported that chemical tests were also conducted at Building 3592. The locations of former Buildings 3590 and 3592 could not be determined. A clearing located on the southwestern boundary of the area, adjacent to the reservoir, shows evidence of former structures. It is possible that Building 3590 or Building 3592 was located within that clearing. Explosive materials such as C4, Composition B, and normal propyl nitrate were stored in Building 3566.

A drop tower, Building 3576, was constructed to test the structural integrity of rocket components. According to ANL 1991, there was a dump area behind Building 3576 on the east or southeast side of the G-2 Test Area.

Buildings 3553 and 3558 remote control facilities, supported test operations in the G-1 and G-2 Test Areas, respectively. An additional building, a simulated missile magazine, was located in either Test Area G-1 or G-2. The building was used to monitor propellant pressure control reactions. The exact location of the building could not be identified, because both areas have undergone significant demolition.

According to Picatinny personnel, Site 1 was used for flare tests in the early 1980s and in the 1990s as a training area for anti-mech/defensive combat and offensive combat/helicopter operations. Tanks, armored personnel carriers, and inert ordnance were commonly used in these training maneuvers.

Compounds used throughout the test area included: nitric and other acids, chlorine trifluoride, cyanide, phenols, metals, and pickling liquors. Herbicides were applied around the test stands to reduce vegetation and the hazards of fire. Concrete and cast iron drainage pipes that terminate in the southwest corner of Site 1 indicate that runoff or process wastewaters were conveyed to the adjacent reservoir. The originating point of these pipes could not be identified in the field.

Most structures within Test Areas G-1 and G-2 were demolished using bulldozers and cranes with wrecking balls. Debris that could not be salvaged was reportedly buried in place. Buildings 3576 and 3578 are the only structures that remain at Site 1. Many of the existing buildings and former structures such as the reported dump area behind Building 3576 and the transformers were investigated during the Phase II RI (Round 1).

Review of the Master Plan does not indicate that there are currently any plans for future construction at PICA-008 (007)/Site 1.

Figure 3-100 shows the layout of PICA-008 (007)/Site 1. It should be noted that the only media included at this site in this FS is soil. The other media are addressed in a separate FS.

### 3.42.2 Previous Studies at Site 1

Four previous investigations have been conducted at two areas within Site 1. A summary of the investigations of soils is presented below. Specific details can be found in the RI (IT 2001b). Investigations regarding other media at Site 1 are discussed in the Group 3 Sites FS (Shaw 2005f).

Soil sampling was conducted at Ames Brook from November 1988 to April 1989. One soil sample was analyzed for metals, VOCs, SVOCs, PCBs, explosives, nitrate, and nitrite.

Phase II (Round 1) RI sampling activities at Site 1 were conducted between May 1995 and November 1996. The subsequent Group 3 RI field operations were conducted at Site 1 from December 1997 to April 1998. ERA sampling for the RI occurred from May through December 1998. Site 1 was used as a reference location for the Phase II ERA. The activities conducted during the Phase II RI for Site 1 included the following:

- Performance of a geophysical survey to confirm the presence or absence of USTs and to locate the reported dump area in the vicinity of the drop tower.
- Performance of a soil gas survey (46 samples total). Twelve additional samples were collected to investigate possible downgradient contamination, with no target analytes being detected. Four additional samples were collected in the asphalt road downgradient to Building 3565 to determine if solvent impacts identified at Site 2 were present in Site 1. Further information can be found in Appendix B of Volume 1 of the Phase II (Round 1) RI Report (ICFKE 1999).
- Collection of 27 surface soil samples at 16 locations.
- Collection of 12 subsurface soil samples coincident with seven surface soil locations.
- Excavation of three test pits to investigate anomalies identified with the geophysical survey and collection of five subsurface soil samples. Information on

the test pit results can be found in Appendix F of Volume 1 of the Phase II (Round 1) RI Report (ICFKE 1999).

A soil boring was drilled downgradient of the sump at Former Building 3555 and no concentrations above SC were observed in the subsurface soil samples. Although additional investigation was not warranted, the sump at Building 3555 was removed in 2004, under a separate action.

#### 3.42.3 Nature and Extent of Contamination

Analytical data available in the Picatinny data base is included in Appendix A. Sample locations where the SC were exceeded are shown on Figure 3-101.

No constituents were detected at concentrations greater than the SC in surface soils. Lead was detected in subsurface soils at a concentration of 4,410 mg/kg (SC = 800 mg/kg) at sample location J-1-TP-002. No other constituents in subsurface soils exceeded the respective SC at Site 1.

Results for sediments, surface water, and groundwater at Site 1 are discussed in the Final FS, Group 3 Sites (PICA-008) (Shaw 2005f), and are addressed in the Final Pre-Design Technical Memorandum for Groundwater and Sediments, Group 3, Sites 1, 2, and 4 (PICA-008) (ARCADIS 2009c).

#### 3.42.4 Summary of Risk Assessment

##### 3.42.4.1 Human Health

An HHRA was completed in 2001 for Site 1 receptors in the Phase II Group 3 Sites RI Report (IT 2001b). The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk and noncarcinogenic hazard at Site 1 are summarized in Table 3-1.

Current human health risks under reasonably, anticipated future use scenarios are:

- Current and Future Industrial/Research Worker (surface soil): carcinogenic risk of 1E-05 and a noncarcinogenic HI of <1.

- Current and Future Construction/Excavation Worker (combined soil): carcinogenic risk of 1E-06 and a noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.42.4.2 Lead Blood Model Results

The current and reasonably anticipated future use scenarios at this site were reevaluated to reflect current guidance for lead model input parameters, as detailed in Appendix C, and the PRG was revised accordingly. The following results were reported:

Current human health risks associated with lead exposures under reasonable, anticipated future use scenarios are:

- Current and Future Construction/Excavation Worker (combined soil): No concern – the average lead concentration of 470 mg/kg is less than the calculated PRG of 957 mg/kg; and
- Lead is not a COPC for surface soil.

#### 3.42.4.3 Ecological

Site 1 is currently inactive and is characterized as containing rubble and debris from past demolition activities. The majority of the structures at the site were decontaminated and demolished prior to 1986. To investigate risks to terrestrial species, an earthworm bioassay was conducted onsite soils that had elevated PAH, arsenic, and beryllium concentrations (IT 2000). The bioassay indicated no significant difference in survival compared to reference or control samples, with results indicating 95% survival of the test organisms. In fact, the test results were used as reference for comparison to other sites. Potential impacts to upper trophic level species such as small mammals (white-footed mouse *Peromyscus leucopus*), worm-eating birds (woodcock, *Scolopax minor*), and carnivorous birds (barred owl, *Strix varia*) were also evaluated by calculating EEQs for each species through a food web exposure model (IT 2000). The EEQs represent the ratio of potential exposure concentrations to toxicological benchmarks. An EEQ value less than 1 indicates that the potential for risk is minimal. The calculated EEQs were less than 1 for all chemicals with the exception of the arsenic EEQ for the white-footed mouse, which was slightly elevated. Based on

these results, it was determined that risks to terrestrial receptors were minimal and did not require further evaluation (Shaw 2005f).

#### 3.42.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonable, anticipated future use (military/industrial):

- The carcinogenic risks are within the generally acceptable risk range of 1E-04 and 1E-06;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a concern at this site; and
- The ecological risk assessment determined that risks to terrestrial receptors were minimal and did not require further evaluation.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.43 PICA-008/Site 2 – Buildings 3500 through 3551, Reaction Motors, Rocket Test Areas A, B, and C**

#### 3.43.1 Site History

Site 2 was owned by the Department of the Army and was leased to the NARTS division of the Navy, which entered into a sublease agreement with the Reaction Motors Division (RMD) of Thiokol Chemical Company in 1947. The sublease with RMD expired in 1968.

RMD tested and evaluated rocket engines and their related components at Site 2, including the Regulus Class I, Sparrow III, and Bullpup rockets. Components developed and tested in Test Areas A, B, and C ranged from gas generators for jet engines to power sources for guided missile systems. Other operations known to have

occurred in these test areas include new and alternative rocket fuel development and engine redesign. Rocket test firings were horizontal, creating the potential for dispersion of exhaust. The engine was braced against a reinforced-concrete block mount within the test stand. The test bays were constructed in pairs with a control and instrument room between each pair.

Other relevant activities at Site 2 included explosive test sheds, explosive magazines, a photographic lab, a garage, a maintenance shop and instrument lab, a heavy-equipment storage compound, a passivation house (Building 3537) using solvents to clean rocket components, and a sewage treatment facility.

Chemicals and products used throughout Site 2 included alcohol-, amine-, and petroleum-based propellants, liquid oxygen, liquid nitrogen, ammonia, nitric acid, hydrogen peroxide, fluorine gas, fluorine nitric acid, hydrazine, unsymmetrical methylhydrazine (UDMH), monomethylhydrazine (MMH), halogenated fluoride-based oxidizers, boranes and borols (alcohol-boron mixtures), inhibited white fuming nitric acid (IWFNA) and inhibited red fuming nitric acid (IRFNA), sulfuric acid, antimony, aluminum perchlorate, ammonium perchlorate, JP-4 and JP-5, magnesium- and aluminum-containing slurries, nitrogen tetroxide, peroxides, and Otto fuel (propylene glycol dinitrate, di-n-butyl sebacate, and 2-nitrodiphenylamine). USTs containing gasoline and #2 fuel oil were formerly present onsite along with transformer pads.

Many of what are referred to as "buildings" within Site 2 are actually test stands, magazines, or storage tanks. The majority of the buildings were decontaminated and demolished between 1968 and 1986, and currently Test Areas B and C remain inactive and unimproved. Since 1986, the 469th Engineer Battalion has constructed new buildings in the northwestern portion of Test Area A. However, the battalion no longer occupied the new buildings. Current plans include construction of a facility for homeland security training activities.

Figure 3-102 shows the layout of PICA-008/Site 2. It should be noted that the only media included at this site in this FS for Site 2 is soil. The other media are addressed in a separate FS.

#### 3.43.2 Previous Studies at Site 2

There are three defined areas within Site 2: Test Area A, Test Area B, and Test Area C. Previous soil studies performed at these test areas are summarized in the following sections. Investigations regarding other media at Site 2 are discussed in the Group 3 Sites FS (Shaw 2005f).

### Site 2, Test Area A

Test Area A contained a tank farm composed of nine USTs that held both gasoline and No. 2 fuel oil, and were more than 20 years old when they were removed in 1990. In addition to the tank farm removal, one 6,000-gallon No. 2 fuel oil UST was removed from the area between Buildings 3515 and 3525. According to the report prepared by CEA, post-remedial soil analysis identified TPH concentrations in excess of NJDEP cleanup standards of 100 ppm. A 3,000-gallon, No. 2 fuel oil UST formerly located northwest of the tank farm and near Building 3518 was also removed in 1990. Analytical results regarding this investigation are provided in Appendix C of the Picatinny Phase II RI/FS Work Plan, Final (ICFKE 1994).

Soil samples were collected at Building 3517 in response to a leaking 55-gallon drum incident in 1986. After an initial removal of 15 cubic yards of contaminated soil, 19,961 ppm TPH were detected in soil corings at a depth of 39 inches. As a result, Weston implemented a RCRA closure plan in April 1991. The closure included the removal of soil followed by steam cleaning. Additional investigation of this area was performed during the Group 3 RI.

According to the ANL RI Concept Plan (1991), a tanker truck spilled 300 gallons of diesel fuel over a 2,500-square-foot area near Building 3513 in January 1988. Cleanup of the spill included removal of soil and asphalt and collection of soil samples. Another spill of 50 gallons of diesel fuel was reported in February near Building 3513. According to Picatinny Environmental Office personnel, visually contaminated soil was removed. No confirmatory sampling was conducted.

From 1995 to 1998, the Phase II (Round 1) RI and the Group 3 RI were conducted at Site 2 including Test Area A. Many of the buildings and structures in Test Area A were investigated including the drum washout area, the former concrete test stand drainage trough and the RCRA closure area at Building 3517.

### Site 2, Test Area B

From 1995 to 1998, the Phase II (Round 1) RI and the Group 3 RI were conducted at Site 2 including Test Area B. Many of the buildings and structures in Test Area B were investigated including former rocket testing activities at Building 3526 and former rocket fuel storage and fueling activities at former Building 3530. A summary of the Phase II (Round 1) RI and the Group 3 RI for Site 2 are provided in Section 2.3.3.

Site 2, Test Area C

A single No. 2 fuel oil UST located next to Building 3547 was removed in 1990. Post-closure soil sampling and analysis revealed no concentrations of petroleum hydrocarbons above the NJDEP soil cleanup standard of 100 ppm. Analytical results regarding this investigation are provided in Appendix C of the Picatinny Phase II RI/FS Work Plan Final (ICFKE 1994).

Phase II (Round 1) RI sampling activities at Site 2 were conducted between May 1995 and November 1996. The subsequent Group 3 RI field operations were conducted at Site 2 between December 1997 and April 1998. Sampling conducted specifically for the ERA occurred from May 1998 through December 1998. Activities conducted during the Phase II RI for Site 2 included the following:

- Performance of two geophysical surveys.
- Performance of a soil gas survey. Three surveys were performed in Test Area B near former Buildings 3527, 3530, and 3537 to delineate areas of potential solvent contamination.
  - Building 3515 and Vicinity – This area was investigated with a total of 69 soil-gas samples.
  - Building 3527 - A total of 13 soil-gas samples were collected in the vicinity of Building.
  - Building 3530 - Four soil-gas samples were collected northeast of former Building 3530 near the metal I-beams related to the former test stand. .
  - Building 3537 - A total of 15 soil-gas samples were collected from the area around this building.
- Collection of 40 surface soil samples at 18 locations.
- Collection of 21 subsurface soil samples.
- Excavation and sampling of two test pits and collection of five subsurface soil samples.

- Installation of one soil boring and collection of four subsurface soil samples.
- Collection of 37 subsurface soil samples.

### 3.43.3 Nature and Extent

Analytical data available in the Picatinny data base is included in Appendix A. Figure 3-103 shows the locations of SC exceedances at Site 2.

Nine surface soil samples and one sub-surface soil sample had concentrations of Aroclor 1254 greater than the SC (1 mg/kg), in the vicinity of Buildings 3506, 3507, and 3508. The highest concentration of 10 D mg/kg Aroclor 1254 was detected at J-B3517-SS-20, 0-1 ft bgs. Three surface soil samples had concentrations of chromium greater than the SC (200 mg/kg). The highest concentration of 2020 mg/kg chromium was detected at sample location J-2-SS-001C, 0-1 ft bgs.

Two SVOCs, 0.67 mg/kg benzo(a)pyrene (SC = 0.2 mg/kg) and 20 mg/kg naphthalene (SC = 17 mg/kg), were detected at one subsurface soil sample, J-2-MW-005, 10-12 ft bgs.

No other constituents were detected in surface or subsurface soil at concentrations greater than the SC.

Results for sediments, surface water, and groundwater at Site 1 are discussed in the Final FS, Group 3 Sites (PICA-008) (Shaw, 2005d), and are addressed in the Final Pre-Design Technical Memorandum for Groundwater and Sediments, Group 3, Sites 1, 2, and 4 (PICA-008).

### 3.43.4 Summary of Risk Assessment

#### 3.43.4.1 Human Health

An HHRA was completed in 2001 for Site 2 receptors in the Phase II Group 3 Sites RI Report (IT 2001b). The estimated reasonable maximum exposure risks for reasonable, anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk and noncarcinogenic hazard at Site 2 are summarized in Table 3-1.

Current human health risks under reasonable, anticipated future use scenarios are:

- Current and Future Outdoor Maintenance Worker (surface soil): carcinogenic risk of 6E-06 and a noncarcinogenic HI of <1;
- Current and Future Industrial/Research Worker (surface soil): carcinogenic risk of 1E-05 and a noncarcinogenic HI of <1; and
- Current and Future Construction/Excavation Worker (subsurface soil): carcinogenic risk of 3E-06 and a noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

#### 3.43.4.2 Lead Blood Model Results

The lead blood model was not calculated at this site as lead was not identified as a COPC in site media.

#### 3.43.4.3 Ecological

To investigate risks to terrestrial species, an earthworm bioassay was conducted onsite soils (IT 2000). The bioassay indicated a significant decrease in survival compared to reference or control samples, however it was noted that soils for the test were collected from an area that had been significantly altered, including the spreading of gravel for maintenance work. It was concluded that the observed toxicity could likely be attributed to the physical characteristics of the soil rather than the presence of contaminants of concern (COCs). Potential impacts to upper trophic level species such as small mammals (white-footed mouse *Peromyscus leucopus*), worm-eating birds (woodcock, *Scolopax minor*), and carnivorous birds (barred owl, *Strix varia*) were also evaluated by calculating EEQs for each species through a food web exposure model (IT 2000). The EEQs represent the ratio of potential exposure concentrations to toxicological benchmarks. An EEQ value less than 1 indicates that the potential for risk is minimal. The calculated EEQs were less than 1 for all chemicals with the exception of the arsenic and aluminum EEQ for the white-footed mouse, which were slightly elevated. Based on these results, it was determined that risks to terrestrial receptors were minimal and did not require further evaluation at this site (IT 2000; Shaw 2005f).

#### 3.43.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonable, anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-04 and 1E-06;
- The noncancer hazard is less than the threshold of 1;
- Lead is not a COPC at this site; and
- The ecological risk to terrestrial species is minimal.

No additional human health risks were calculated for hypothetical use scenarios.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### 3.44 PICA-008/Site 4 – 3600 Series Buildings, Test Areas D and E

#### 3.44.1 Site History: Site 4, Test Area D

Site 4 is divided into Rocket Test Area D (Buildings 3600-3616, 3620, 3628-31) and Test Area E (3617-3619, 3622, 3623, 3625, and 3627), both of which were operated by the NARTS division of the Navy. The layout of Site 4 is shown on Figure 3-104.

#### Site 4 – 3600 Series Buildings

Operations known to have occurred in the test areas within Site 4 from 1951 until 1968 included new and alternative rocket fuel development and engine redesign. Test Area D is still active. Besides Army training activities, Test Area E has remained inactive since 1968. Although few structures in Test Area E have been demolished, the majority of rocket test stands within Test Area D have been demolished.

Activities in both test areas of Site 4 revolved around buildings referred to as test stands, which were used to test liquid and solid fuel rocket engines, turbine pumps,

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

and other rocket motor components. Rockets firings were typically horizontal, creating the potential for dispersion of exhaust and non-combusted materials. The test stands were washed down after each test firing. Collection basins, exhaust pits, and trough systems were used to collect the wash down wastewaters. During testing, the rocket engine was braced against a reinforced-concrete block mount with the stand. Behind the firing mounts, separated by concrete walls within the test stand structure, were fuel and oxidizer ASTs, which ranged in capacity from 250 to 3,300 gallons. According to former RMD personnel and NARTS literature, fuels and oxidizers used at these stands in Test Areas D and E included hydrazine, UDMH, MMH, mixed amine fuels, helium, ammonia, halogenated fluoride-based oxidizers, liquid oxygen, alcohols, white fuming nitric acid, red fuming nitric acid, sulfuric acid, aluminum perchlorate, nitrogen tetroxide, and peroxides. Rocket fuels used in small quantities were stored in drums or cylinders in concrete magazines.

Test Area D was used by the NARTS division of the Navy from 1951 to 1968 under a lease from the Department of the Army to test rocket engines and their related components. Rocket testing reportedly ended when the Navy's lease with the Army expired in 1968. Accordingly, explosive and fuel allowances for the area were reportedly cancelled in 1970. Many buildings within Test Area D, although referred to as "buildings", are actually test turrets, rocket test stands, or concrete pads.

All of the rocket test pads and stands are currently inactive. After rocket testing ended in 1968, small mines were tested for an unknown period of time within Test Area D.

In 1975, a Ballistic Rail Gun (BRG), Building 3620, was constructed in the southern part of Test Area D. The BRG is still in operation and consists of a trough filled with water and in the winter, anti-freeze. The trough allowed the soft recovery of conventional shells fired from a 115-mm Howitzer cannon.

Test Area D has also been documented as containing a range for testing 22-, 38- and 45- caliber hand guns. However, the existence of this range could not be verified during site visits.

Presently, Test Area D is active. At least four buildings are devoted to operations, storage, and support for the Hawk Radar system. Three buildings are devoted to ordnance disassembly. Specifically, Building 3611 is a photography lab where pictures of disassembled ordnance from Building 3612 are developed.

Hazardous substances are still used in Test Area D. According to the 1991 ANL RI Concept Plan, three buildings within the area were listed as RCRA hazardous waste accumulation areas: a concrete slab within Building 3607 stored paint, solvents, and aerosol cans; a steel box outside Building 3611 stored photographic chemicals; and Building 3612 generated contaminated rags and solvents. Explosive containers were observed in the shed behind Building 3612.

There are also three transformers pads (TR-3600D, TR-3602, and TR-3602A) in Test Area D. All transformers have been removed as part of a facility-wide transformer removal action completed in the 1990s and were investigated for potential PCB contamination during the Phase II (Round 1) RI.

#### Site History: Site 4, Test Area E

Test Area E occupies 14 acres at the top of the ridge that overlooks Test Area D. The area was operated by the NARTS division of the Navy under a lease from the Department of the Army from 1953 to 1968. NARTS used Test Area E to test and develop highly volatile rocket fuels and rocket propulsion systems. Testing of the X-15 rocket motor was conducted in Test Area E, under a use-agreement with Thiokol Chemical Company. Rocket testing reportedly ended when the Navy's lease with the Army expired in 1968. Although the area is inactive, numerous M-16 rifle-blanks found during a 1992 site visit suggest that this area was used as a training area. Many buildings in Test Area E, although referred to as "buildings," are actually test turrets, rocket test stands, or concrete pads.

Test Area E consists of five structures (Buildings 3617, 3619, 3622, 3623, and 3627) and two test stands (Buildings 3618 and 3625). Steel supports, rubble, and four drainage pipes located south of Building 3627 indicate that additional structures, now demolished, may have been part of Test Area E.

Rocket testing evolved around rocket test stand E-1 located at the northern end of Building 3618. Rocket engine testing occurred over a 65-foot-deep, water-filled, rectangular pit located behind Building 3618. The water in the pit was reportedly used to absorb the force of rocket engine exhaust. According to the 1991 ANL RI Concept Plan (ANL 1991), the exhaust pit was lined with gunnite in 1965 or 1966 to prevent leaking. Before the exhaust pit was lined, however, materials in the exhaust pit most likely leached into the ground. Located on the first floor of Building 3618 was a tank room for fuel and oxidizer storage and separate cascade rooms for pressurizing fuels with nitrogen. A 2,500-gallon outdoor liquid oxygen (LOX) tank, Building 3619, was set

above ground on four cement pilings and was associated with testing at Building 3618. The LOX tank has been removed but the cement pilings remain.

The control room for Test Stand E-1 was located below grade in Building 3617. Electrical cables connected the two buildings via a vaulted utility conduit. Building 3617 also contained a garage, a small components laboratory, and a boiler heated by fuel oil stored in an adjacent UST. Solvents such as TCE and acetone are documented as having been used in Building 3617. Wastewater from this building was discharged to a dry well located northwest of the building.

Building 3622 is a 400,000-gallon water storage tank reportedly used for supplying water for rocket test cooling, washdown, and regional fire control. A vaulted rocket quench-water pump connected Building 3622 with Buildings 3617, 3618, and 3625.

A 1969 Picatinny inventory listed two transformer pads (TR-3617 and TR-3618) within Test Area E. The Picatinny transformer database lists three 37.5-KVA transformers on TR 3617 which were in poor and leaking condition prior to their removal and disposal in the 1990s. However, the three transformers were not contaminated with PCBs. Two 50-KVA transformers were also identified as being in very bad condition and located on TR 3618. The Picatinny transformer database indicated, however, that these transformers were not PCB-contaminated. A third transformer pad, TR 3627, currently abandoned, was observed during the ICFKE site visit. There is no information regarding the PCB status of former transformers on this pad.

Surface water and groundwater at Site 4 are discussed and addressed under the Group 3 Sites FS (Shaw 2005f).

#### 3.44.2 Previous Studies at Site 4

The previous soil investigations conducted at Site 4 are summarized below. Investigations regarding other media at Site 4 are discussed in the Group 3 Sites FS (Shaw 2005f). Additional detail can be found in the Phase II Group 3 RI Report(IT 2001b).

#### Test Area D

UST #48 Closure and DICAR at Building 3603 – Upon removal of UST#48, a discharge was noticed from a leak at the top of the tank. TPH concentrations in the

excavation ranged from 128 to 1,570 mg/kg. Contaminated soil was excavated and disposed off-site.

UST #49 Closure at Building 3608 – Based on remedial soil sampling and analyses, no further action was recommended.

#### Test Area E

UST Closures at Building 3617 and Building 3623 (CEA, Picatinny DICAR Report) – Two #2 fuel oil USTs in adjacent buildings were removed in 1990. Based on post-remedial soil sampling and analyses for TPH, which were less than NJDEP cleanup standards, no further action was recommended.

Building 3618 Site Investigation (Dames and Moore 1989) – Four soil samples were collected behind Building 3618. The report concluded that neither surface water nor soils in Test Area E were contaminated.

#### Phase II RI Sampling:

The Phase II (Round 1) RI sampling activities at Site 4 were conducted between May 1995 and November 1996. Subsequent Group 3 RI field operations were conducted at Site 4 from December 1997 to April 1998. ERA sampling for the RI occurred from May through December 1998. Overall, the Phase II RI sampling program for Site 4 included the following:

- Performance of two geophysical surveys.
- Performance of two soil gas surveys.
- Collection of 52 surface soil samples at 25 locations – These surface soil samples included four samples at monitoring well locations, two samples at soil boring locations, and two samples at test pit locations. Samples 4SS-6A and 4SS-13A were collected near transformer pads.
- Collection of 43 subsurface soil samples – These samples included 17 subsurface soil samples at nine surface soil locations, 18 samples at monitoring well locations, four samples at soil boring locations, and four samples at test pit locations.

- Soil samples were collected at the outfalls of the Test Area D sump and the Test Area E sump.
- Excavation of two test pits to investigate the two anomalies identified with the geophysical survey at the south and west sides of Building 3617 at Test Area E. Test Pit 4TP-1, located to the south of Building 3617.
- Installation of two soil borings and collection of four subsurface soil samples.

As part of a separate action, the sumps in Test Area D and Test Area E were removed in 2004.

#### 3.44.3 Nature and Extent

Data available in the Picatinny data base is included in Appendix A. Figure 3-105 shows the locations where constituent concentrations exceeded the SC.

Aroclor 1254 (SC = 1 mg/kg) was detected in surface soils at three sample locations. The highest concentration of 2.7 N mg/kg was detected at sample location J-4-SS-014A, 0-1 ft bgs. No other constituents were detected at concentrations greater than the respective SC in surface soils at Site 4.

Results for sediments, surface water, and groundwater at Site 1 are discussed in the Final FS, Group 3 Sites (PICA-008) (Shaw, 2005d), and are addressed in the Final Pre-Design Technical Memorandum for Groundwater and Sediments, Group 3, Sites 1, 2, and 4 (PICA-008) (ARCADIS, 2009c).

#### 3.44.4 Summary of Risk Assessment

##### 3.44.4.1 Human Health

An HHRA was completed in 2001 for Site 4 receptors in the Phase II Group 3 Sites RI Report (IT 2001b). The estimated reasonable maximum exposure risks for reasonable, anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk and noncarcinogenic hazard at Site 4 are summarized in Table 3-1.

Current human health risks under reasonable, anticipated future use scenarios are:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Current Outdoor Maintenance Worker: carcinogenic risk of 7E-06 and a noncarcinogenic HI of <1;
- Future Outdoor Maintenance Worker: carcinogenic risk of 7E-06 and a noncarcinogenic HI of <1;
- Current and Future Industrial/Research Worker: carcinogenic risk of 1E-05 and a noncarcinogenic HI of <1; and
- Future Construction/Excavation Worker: carcinogenic risk of 9E-07 and a noncarcinogenic HI of <1.

No additional human health risks were calculated for hypothetical use scenarios.

### 3.44.4.2 Lead Blood Model Results

The lead blood model was not calculated for soils at this site as lead was not identified as a COPC in this media.

### 3.44.4.3 Ecological

Potential impacts to upper trophic level terrestrial species such as small mammals (white-footed mouse *Peromyscus leucopus*), worm-eating birds (woodcock, *Scolopax minor*), and carnivorous birds (barred owl, *Strix varia*) at Site 4 were evaluated by calculating EEQs for each species through a food web exposure model (IT, 2000). The EEQs represent the ratio of potential exposure concentrations to toxicological benchmarks. An EEQ value less than 1 indicates that the potential for risk is minimal. The calculated EEQs were less than 1 for all chemicals with the exception of the arsenic and aluminum EEQ for the white-footed mouse, which were slightly elevated. Based on these results, it was determined that risks to terrestrial receptors were minimal and did not require further evaluation at this site (IT 2000; Shaw 2005f).

### 3.44.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site, for current and reasonable, anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-04 and 1E-06;

- The noncarcinogenic hazard is less than the threshold of 1;
- Lead in sump sediment is not a concern as the average concentration is less than the calculated PRGs; and
- The ecological risk for terrestrial species is minimal.

No additional human health risks were calculated for hypothetical use scenarios. Groundwater at this site is being handled under a separate CERCLA action.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because residential use risk scenarios were not evaluated and concentrations of some constituents exceed residential screening criteria, this site cannot be released for unrestricted use.

### **3.45 PICA-013/Site 78 – Building 91, Optics Prototype Facility**

#### 3.45.1 Site History

The only media addressed for this site in this FS are soil and sediment. The other media at this site have been addressed under separate CERCLA Decision Documents.

Environmental impacts at Site 78 (PICA-013) are associated with historical activities conducted at Building 91. The RI Reported that the building was constructed in 1942 as a storehouse and supply building, and contained an optics laboratory in which operations were conducted between 1980 and the mid-1990s. Currently, an office space is located within Building 91, and the loading docks receive materials, some of which are hazardous.

The RI Reported operations carried out in the former optics laboratory involved the storage and use of aluminum powder, copper powder, phosphoric acid, nitric acid, hydrochloric acid, sulfuric acid, ceric oxide, blasting grit, Freon, epoxy, chrome, and acetone. A hazardous waste storage area was located at the north end of the building, in which sodium hydroxide, nitric acid, oil (silicon), machine shop cutting fluids, boric acid, silver-containing photograph development fluid, and potassium borate were stored (Shaw 2005g).

Two Number 2 fuel oil USTs were located on the southeast side of Building 91: one 3,000 gallon tank was situated approximately 7 ft south of the loading dock area, and

one 7,500 gallon tank was located approximately 60 ft east of the new utility room. The tanks were reported active until 1998, with no record of any spills. Both USTs were removed in 1999, and replaced by one aboveground storage tank for fuel oil supply (Shaw 2005g).

As indicated in the Master Plan, there are currently plans for construction of a general purpose warehouse at PICA-013/Site 78.

Figure 3-106 shows the layout of Site 78.

#### 3.45.2 Previous Investigations

Two surface soil samples were collected during the 1996 PA/SI, and were analyzed for VOCs, SVOCs, explosives, pesticides, PCBs, and metals.

As part of the Phase III-1A RI Sampling program, 25 surface soil samples were collected in multiple rounds of sampling.

- Thirteen samples were analyzed for SVOCs;
- Two samples were analyzed for SVOCs and explosives;
- Five samples were analyzed for PAHs;
- One sample was analyzed for VOCs, SVOCs, and PAHs; and
- Four samples were analyzed for VOCs.

Six sediment samples were collected during the Phase III-1A RI Sampling program.

- One sample was analyzed for VOCs, SVOCs, and metals;
- One sample was analyzed for SVOCs and metals; and
- Four samples were analyzed for VOCs.

### 3.45.3 Nature and Extent

Historical analytical data available from the Picatinny Database for Site 78 is included in Appendix A. The results of soil and sediment data are discussed in this FS; however, surface water and groundwater are addressed separately in the Site 78 (PICA-013) ROD (USEPA 2011). Figure 3-107 shows the locations of SC exceedances at Site 78.

Sixteen surface soil samples had detections of at least one of five SVOCs at concentrations greater than the respective SC; benz(a)anthracene (SC = 2 mg/kg), benzo(a)pyrene (SC = 0.2 mg/kg), benzo(b)fluoranthene (SC = 2 mg/kg), dibenz(a,h)anthracene (SC = 0.2 mg/kg), and indeno(1,2,3-c,d)pyrene (SC = 2 mg/kg). Maximum concentrations of 14.1 D mg/kg benz(a)anthracene, 10.7 mg/kg benzo(a)pyrene, 14.5 D mg/kg benzo(b)fluoranthene, 1.71 mg/kg dibenz(a,h)anthracene, and 6.51 mg/kg indeno(1,2,3-c,d)pyrene were all detected at sample location P-78-SS-005, 0-1 ft bgs. There were no other constituents detected in Site 78 soils at concentrations greater than the respective SC.

Methylene chloride (SC = 0.37 mg/kg) was detected at a concentration of 0.97 J mg/kg in sediment sample P-78-SD-001, and acetone (SC = 0.0087 mg/kg) was detected at a concentration of 0.06 J mg/kg at sediment sample P-78-SD-006. No other VOCs were detected in sediments at Site 78. Two sediment samples had detections of at least one of eight SVOCs at concentrations greater than the respective SC; benzo(a)anthracene (SC = 0.0317 mg/kg), benzo(a)pyrene (SC = 0.0319 mg/kg), benzo(b)fluoranthene (SC = 0.0272 mg/kg), benzo(k)fluoranthene (SC = 0.0272 mg/kg), chrysene (SC = 0.0571 mg/kg), fluoranthene (0.06423 mg/kg), phenanthrene (SC = 0.0419 mg/kg), and pyrene (0.0530 mg/kg). Maximum detections of 0.1 J mg/kg benzo(a)anthracene, 0.11 J mg/kg benzo(a)pyrene, 0.12 J mg/kg benzo(b)fluoranthene, 0.08 J mg/kg benzo(k)fluoranthene, 0.12 J mg/kg chrysene were detected at sediment sample location P-78-SD-002. Maximum detections of 0.31 J mg/kg fluoranthene, 0.15 J mg/kg phenanthrene, and 0.28 J mg/kg pyrene were detected at location P-78-SD-001. Six metals were detected at P-78-SD-001; 21.17 mg/kg arsenic (SC = 16 mg/kg), 4.35 mg/kg cadmium (SC = 1.7 mg/kg), 50.58 J mg/kg copper (SC = 28 mg/kg), 67.64 J mg/kg lead (SC = 38.8 mg/kg), 0.44 J mg/kg mercury (SC = 0.249 mg/kg), and 174.7 mg/kg zinc (SC = 171 mg/kg). Cadmium (2.13 mg/kg), copper (49.34 J mg/kg), lead (78.62 J mg/kg), and zinc (300.79 mg/kg) were also detected at P-78-SD-002. No other constituents were detected above the respective SC in sediments at Site 78.

Surface water and groundwater at Site 78 are discussed and addressed under the approved ROD for groundwater and surface water for Site 78 (PICA-013) (USEPA

2011). Drainages from Site 78 are addressed under the approved GPB/BSB ROD (Shaw 2004c).

#### 3.45.4 Summary of Risk Assessment

##### 3.45.4.1 Human Health

An HHRA was completed in 2005 for Site 78 receptors in the Site 78 RI Report and Groundwater Pilot Study Work Plan (Shaw 2005g). The estimated reasonable maximum exposure risks for reasonable, anticipated future use exposure scenarios are within or less than USEPA's generally acceptable risk range of 1E-06 to 1E-04. Within this range, site-specific decisions can be made regarding the need for remedial action. The results of the HHRA calculations for carcinogenic risk and noncarcinogenic hazard at Site 78 are summarized in Table 3-1.

Current human health risks under reasonable, anticipated future use scenarios are:

- Current and Future Industrial/Research Worker: carcinogenic risk of 1E-04; the noncarcinogenic HI was not calculated, as there were no noncarcinogenic COPCs in soil.

Additionally, human health risks were calculated for hypothetical use scenarios not reasonably anticipated and are as follows:

- Future Adult Resident (soil): carcinogenic risk of 2E-04/ noncarcinogenic HI was not evaluated.
- Future Child Resident (soil): carcinogenic risk of 1E-04/ noncarcinogenic HI was not evaluated.

##### 3.45.4.2 Lead Blood Model Results

The lead blood model was not calculated at this site as lead was not identified as a COPC in site media.

##### 3.45.4.3 Ecological

Site 78 is located in the southwest portion of Area P between Fourth Avenue and GPB. The entire area in the vicinity of the site is paved or maintained lawn, providing

essentially no suitable habitat for wildlife receptors. There are numerous drainage ditches which direct storm water runoff to GPB, however, these ditches do not represent significant aquatic habitat. It is important to note that potential risks associated with GPB itself, are addressed under the GPB and BSB ROD (USEPA USEPA. 2004b).

Soil samples collected in the vicinity of Building 91 indicate elevated levels of PAHs immediately adjacent to the building. In addition, PAHs and metals have been detected in the sediments of the drainage canals at concentrations above levels of concern. However, evaluations in GPB found no measurable biological impacts related to sediments downstream of Site 78 (Shaw 2004a).

Due to the limited extent of PAH contamination in soils and the lack of evidence indicating impacts associated with elevated PAHs and metals in sediments, an ecological evaluation was not recommended for Site 78 (Shaw 2004a).

#### *3.45.4.4 Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonable, anticipated future use (military/industrial):

- The carcinogenic risk is within the generally acceptable risk range of 1E-04 and 1E-06;
- The noncarcinogenic hazard is less than the threshold of 1;
- Lead is not a COPC at this site; and
- Based on limited habitat and the lack of evidence indicating impacts associated with PAHs and metals in sediments and soils, significant impacts or ecological risks are not expected at this site.

Additional human health risks were evaluated for hypothetical residential use scenarios; however, the results of the evaluations indicate that the risks exceed the generally acceptable risk range, but the HIs are less than or equal to 1.

There are no unacceptable risks for the reasonably anticipated land use (military/industrial); however, because the hypothetical residential use risk scenarios

indicate risks and/or hazards that exceed the generally acceptable risk range or HI of 1, respectively, this site cannot be released for unrestricted use.

### **3.46 PICA-011/Site 122 – Building 60 Satellite Waste Accumulation Area**

#### **3.46.1 Site History**

Site 122 encompasses Building 60 and is located in the central manufacturing area (Area D) situated in the southwestern portion of PTA. Building 60 is located at the southern corner of the intersection of Second Avenue and Fourth Street, along the northern bank of BSB. Building 60 is encircled by Buildings 22 and 64 (buildings along the southern bank of BSB) to the east-southeast, Building 24 to the northeast, Building 66 to the northwest, and Building 63 to the southwest. Building 60 was constructed in 1942 as an environmental testing laboratory and is a one-story hollow tile wall building with a floor area of approximately 28,646 square feet (ft<sup>2</sup>). The building has a concrete foundation, a concrete floor, and a gable roof truss covered with corrugated asbestos. Figure 3-108 presents the layout of Site 122.

Over the years, Building 60 has primarily been used as a testing laboratory. Various types of testing conducted in the building include: ballistic air gun launch testing, drop testing, solar radiation testing, and mechanical stress, shock, vibration, jolt, and static load testing. Additionally, until 1984, inert radioactive warheads testing was performed in this building. Radioactive materials were stored in a vault located at Building 60. According to PTA personnel, no radioactive material is currently being stored in this vault.

The various testing equipment and machines at Building 60 utilize lubricating, hydraulic, and heating oils. Heating oils were formerly stored in Building 60-A, which was located on the west side of Building 60. No information was available on the current storage location of the heating oils at Building 60. The heating oils are used in various types of temperature testing equipment to raise the temperature of circulating water within the system. The recirculation water/steam was discharged into BSB via various pipes projecting out of the southern wall of the building. This discharged has since been discontinued. Waste oils that are generated from the testing equipment are stored at a satellite location area within the building. This storage area is currently equipped with a secondary containment unit. The waste accumulated in this area is picked up by PTA's disposal contractor. Prior to about 1991, the waste oil drums generated at Building 60 may have been stored on a concrete pad or at a former oil storage shed located adjacent to one of the loading docks on the west side of Building

60. Although the nature and quantity of other wastes generated at Building 60 is unknown, a document prepared in February 1980 indicates that a drum of TCE was being stored in Building 60 at that time.

#### 3.46.2 Previous Investigations

Seven environmental investigations and sampling events have been conducted at Site 122/ PICA-011: ARDEC site investigation and cleanup for a dismantled projectile from 1987 to 1988, Water Discharge Investigation in 1990 (Foster Wheeler), SI in 1991 (Chemical Waste Management), Phase I RI in 1995 (Dames & Moore), and Supplemental Phase I RI in 1996 (Dames & Moore 1998), Delineation Sampling events in 1998 and 1999 (IT 1999), and PCB Soil and Sediment Removal Action in 2000 (Shaw 2003).

Following a release incident involving dust of depleted uranium and beryllium in November 1987 when a projectile was dismantled in the Telemetry storage room at Building 60, several wipes and air samples were collected to assess and delineate the extent of contamination. Decontamination operations were performed in February 1988. Additional confirmatory air and wipe samples were collected in 1988 following the cleanup operation.

The Water Discharge Investigation was performed in July 1990 for all ARDEC buildings to identify water discharges emanating from the buildings. Dye tests performed at Building 60 did not indicate any waste streams being discharged to the storm water or BSB.

During the 1991 SI activities, five soil samples were collected underneath a former oil storage shed and a concrete pad that were used to store oil. The concrete pad and the oil storage shed were located adjacent to a loading dock on the west side of Building 60. All five samples were analyzed for VOCs, BNAs, and TPH.

The 1995 Phase I RI included the following field activities:

- A radiological survey;
- Collection of six surface soil samples at locations SS122-1 to SS122-6;
- Collection of five subsurface soil samples at locations SB122-1 and SB122-2; and

- Collection of three surface water/sediment samples at locations SW/SDBS-22 to SW/SDBS-24.

The radiological survey was conducted to identify areas of contamination that might have resulted from spills, leaks, and releases due to handling radioactive material. This survey covered a perimeter of approximately 20 ft around the outside of Building 60.

The surface and subsurface soil samples were analyzed for TCL VOCs, BNAs, TAL metals plus cyanide, explosives, and radiological parameters, including gross alpha, gross beta, and gamma radiation. Additionally, surface soil samples were field tested for PCBs, and one subsurface sample was tested for pesticides/PCBs. The surface water and sediment samples were analyzed for VOCs, BNAs, pesticides/PCBs, metals, cyanide, and TPH.

In order to further characterize the contamination at Site 122, a Supplemental Phase I RI was conducted in 1996. A total of eleven surface soil samples were collected. Eight surface soil samples (122-SS-008 through 122-SS-015) were analyzed for SVOCs, PCBs, and TAL Metals. Two surface samples (122-SS-016 and 017) were analyzed for SVOCs, and one surface sample was analyzed for SVOCs and PCBs (122-SS-018). In addition, four subsurface soil samples were collected to determine the vertical extent of PCB contamination at the west side of the building. Only one groundwater sample was collected and analyzed for PCBs.

Additional sampling activities were conducted in 1998 and 1999 to further delineate the horizontal and vertical extents of PCB contamination identified during RI sampling events at both sides of the building 60. A total of 21 surface soil samples were collected and analyzed for PCBs. In addition, a total of five sediment samples were collected to delineate the extent of PCB contamination in the portion of BSB adjacent to the site. The samples were collected either from 0 to 1 ft or 1 to 2 ft below the top of the sediment and analyzed for PCBs. Upon completion of delineation, four areas with PCB levels above 2.0 ppm, the New Jersey non-residential risk based action level, were identified for removal around Building 60.

During the PCB Soil and Sediment Removal Action in 2000, all PCB-impacted soil with concentrations greater than 2.0 mg/kg was removed to meet the standards at that time, except the south and west sides of W3 areas. In those areas, Aroclor 1248 was present at concentrations greater than the current LOC (1 mg/kg) in post-excavation soil samples D-122-2D9, 2-2.5 ft bgs (64 D mg/kg) and D-122-W3-SW-S(H), 0-0.5 ft bgs (2.6 D mg/kg). These sample locations were not excavated due to their proximity

to pavement at Second Avenue and at a loading dock driveway, which were active PTA areas. It is stated in the approved work plan that the excavations had to be terminated at pavement and building structures to avoid damaging parts of the PTA infrastructure that are currently in use (Shaw 2000). Sample locations which exceeded the LOC for PCBs and were removed from excavation E-1 include: D-122-GR-001 through D-122-GR-027, D-122-SB-001 through D-122-SB-003, D-122-SS-014, and D-SS122-5. Locations removed from excavation W-1 include D-122-SS-1-1 and W-122-SS-1-4. Locations removed from W-2 include D-122-SS11-001 through D-122-SS-011-004, and D-122-SS-011. Locations removed from excavation W-3 include D-122-2D5, D-122-SS12-001 through D-122-SS12-005, and D-122-SS-012. These sample locations are not shown in the figures in order to show the post excavation sample locations clearly. It is estimated that a total of 387 cubic yards of soil and sediment were removed during the remedial action.

Data available from the PTA database for Site 122 are provided in Appendix A, and historical sampling locations are shown in Figure 3-109.

#### 3.46.3 Nature and Extent

In surface soils, six SVOCs were detected in at least one surface soil sample at concentrations greater than the LOC. Maximum concentrations of 50 mg/kg benzo(a)pyrene (LOC = 0.2 mg/kg), 200 mg/kg benzo(b)fluoranthene (LOC = 2 mg/kg), 24 mg/kg benzo(k)fluoranthene (LOC = 23 mg/kg), 4.2 mg/kg dibenz(a,h)anthracene (LOC = 0.2 mg/kg), and 100 mg/kg indeno(1,2,3-c,d)pyrene (LOC = 2 mg/kg) were detected at D-SS122-6. A concentration of 50 mg/kg benzo(a)pyrene was also detected at D-SS122-2. A maximum concentration of 8.8 benz(a)anthracene (LOC = 2 mg/kg) was detected at sample location D-SB122-2.

After the 2000 PCB removals described above, one post excavation surface soil sample still exceeded the former LOC for Aroclor 1248, which was 2 mg/kg, at location D-122-W3-SW-S(H) with a concentration of 2.6 mg/kg. This sample was left in place due to its proximity to existing pavement. The surface soil sample collected at location D-SB122-2 had a detection of 21 mg/kg arsenic (LOC = 19 mg/kg). No other constituents are present in surface soils at concentrations greater than the LOCs. The radiological survey conducted as part of the Phase I RI did not identify any areas with unacceptable high levels of radiation (i.e. greater than 50 microrem per hour [ $\mu$ rem/hr]). The maximum radiation level was 7 rem per hour (rem/hr), which is 2  $\mu$ rem/hr greater than the background level and did not exceed the action level.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

In surface soils, one sample contained arsenic at a concentration of 21 mg/kg (LOC = 19 mg/kg). The three soil samples contained concentrations of manganese that exceeded the LOC of 5900 mg/kg, including D-SS122-6, D-122-SS-008, and D-122-SS-009, which had respective concentrations of 15,000 mg/kg, 9530 mg/kg, and 7610 mg/kg.

In subsurface soils, five SVOCs were detected at concentrations greater than the LOCs. Maximum concentrations of 12 mg/kg benz(a)anthracene (LOC = 2 mg/kg), 13 mg/kg benzo(a)pyrene (LOC = 0.2 mg/kg), 15 mg/kg benzo(b)fluoranthene (LOC = 2 mg/kg), 2.5 mg/kg dibenz(a,h)anthracene (LOC = 0.2 mg/kg), and 9.4 mg/kg indeno(1,2,3-c,d)pyrene (LOC = 2 mg/kg) were detected at D-SB122-1, 2-4 ft bgs. In addition, sample D-122-2D9 was left in place after the PCB soil removals with a concentration of Aroclor 1248 of 64 mg/kg even though it exceeded the former LOC (2 mg/kg) due to its proximity to existing pavement. No other constituents are present in subsurface soils at concentrations greater than LOCs.

In sediments, one dioxin, 0.12 mg/kg octachlorodibenzodioxin (LOC = 0.0085 mg/kg), was detected at sample location D-B-SB-SD-33. Six pesticides were also detected at this location; 0.2 mg/kg 4,4'-Dichlorodiphenyldichloroethane (DDD) (LOC = 0.00354 mg/kg), 0.11 mg/kg 4,4'-Dichlorodiphenyldichloroethylene (DDE) (LOC = 0.00142 mg/kg), 0.06 dieldrin (LOC = 0.00285 mg/kg), 0.04 endrin (LOC = 0.00267 mg/kg), 0.05 mg/kg gamma-chlordane (LOC = 0.0003 mg/kg), and 0.01 mg/kg heptachlor (LOC = 0.0006 mg/kg). PCBs were detected at concentrations greater than LOCs in seven sediment samples. The maximum concentration of 27 mg/kg Aroclor 1248 (LOC = 0.0341 mg/kg) was detected at D-122-E1B-SW-WA. The maximum concentration of 3.37 mg/kg Aroclor 1254 (LOC = 0.06 mg/kg) was detected at D-B-SB-SD-33, and the only concentration of 0.52 mg/kg Aroclor 1260 was detected at D-122-E1B-SW-EA. Seven metals were detected in one sediment sample, D-B-SB-SD-33, at concentrations greater than LOCs; 57.7 mg/kg cadmium (LOC = 1.7 mg/kg), 953 mg/kg chromium (LOC = 37.3 mg/kg), 349 mg/kg copper (LOC = 28 mg/kg), 168 mg/kg lead (LOC = 38.8 mg/kg), 2.16 mg/kg mercury (LOC = 0.249 mg/kg), 2.43 mg/kg silver (LOC = 1 mg/kg), and 349 mg/kg zinc (LOC = 171 mg/kg). Constituents in sediments at Site 122 are addressed as part of Region 3 in the Final Record of Decision, Green Pond Brook/Bear Swamp Brook (Shaw 2004c).

The only constituent detected in groundwater at a concentration greater than the LOC was 17.7 ug/L Aroclor 1248 (LOC = 0.5 ug/L), in a sample collected from D-122-GW-001 in July 1997. The primary source for groundwater contamination in this area has been removed, during the PCB Soil and Sediment Removal Action conducted in 2000.

Constituents in groundwater at Site 122 are addressed under the Final Record of Decision, Area D Groundwater (Shaw 2004).

#### 3.46.4 Summary of Risk Assessment

##### 3.46.4.1 Human Health

An HHRA was completed as part of the Phase I Remedial Investigation Report (RIR) (1995). The results of HHRA calculations for carcinogenic risk and noncarcinogenic hazard at Site 122 are summarized in Table 3-1. There are no cancer risks that are greater than the generally acceptable risk range (1E-4 to 1E-6). The noncarcinogenic hazard is driven by inhalation of manganese.

Current human health risks under reasonably anticipated future use scenarios at Site 122 are:

- Current Outdoor Maintenance Worker: carcinogenic risk of 2E-5/ noncarcinogenic hazard index less than 1.
- Future Industry/Research Worker: carcinogenic risk of 1E-4/ noncarcinogenic hazard index of 8.
- Future Construction/Excavation Worker: carcinogenic risk number of 5E-5/ noncarcinogenic hazard index of 40.

The estimated reasonable maximum exposure risks for reasonably anticipated future use exposure scenarios are within USEPA's risk range (1E-6 to 1E-4). The estimated noncarcinogenic hazard index for industrial/research worker and construction/excavation worker are 8 and 40, respectively, which are greater than USEPA's non-cancer hazard threshold of 1. The constituent driving the hazard for both of these scenarios is manganese. While the calculated hazard indices for the industrial/research worker and construction/excavation worker exceed the threshold of 1, the soil exposure point concentration for manganese is less than the USEPA's soil remediation goal for manganese (23,000 mg/kg).

##### 3.46.4.2 Lead Blood Model Results

Lead was not a COPC at this site, and the Lead Blood Model was not evaluated.

#### 3.46.4.3 Ecological

The Phase I ERA (Dames & Moore, 1997;1998 [PTA.D&M.0042, PTA.D&M.0043]) indicated that there were elevated levels of aluminum and lead in plants, but no evidence that the plant community had been adversely affected. Similarly, concentrations of aluminum, copper, manganese, 4,4'-DDE, 4,4'- DDT, endrin aldehyde, and heptachlor epoxide had bioaccumulated were detected in small mammals, but no associated impact was identified. A food web model indicated potential risk to avian species from bis(2-ethylhexyl)phthalate and metals, however, when the relatively small size of usable habitat and very high human use of the area is considered, exposures to wildlife are likely to be much less. Based on these considerations, risks to ecological receptors are considered to be minimal.

#### 3.46.4.4 Summary of Risks and Hazards

Based on the risk assessments performed for this site for current and reasonably anticipated future use:

- The carcinogenic risk is within the generally acceptable risk range of 1E-4 and 1E-6;
- The noncarcinogenic hazard is greater than 1;
- Lead is not a COPC at this site; and
- Ecological risks are considered to be minimal.

The estimated reasonable maximum exposure risks for reasonable anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-6 to 1E-4. Although the calculated hazard indices for the industrial/research worker and construction/excavation worker exceed USEPA's noncancer hazard threshold of 1 due to manganese, the soil concentrations for manganese is less than the USEPA's soil remediation goal for manganese (23,000 mg/kg). The USEPA and Army agreed as part of the 5-Site Dispute Resolution that soil ARARs will not be required to be attained at Site 122 since USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant that need to be addressed at this site, was not exceeded (USEPA, 2014). Thus although a noncancer hazard was calculated, contaminant concentrations at this site do not present a noncancer hazard that must be actively mitigated. However, to mitigate potential future risks and hazards if released for unrestricted use,

### **3.47 PICA-107/Site 138 – Buildings 404, 407 & 408, Chemical Lab & Propellant Plant**

#### 3.47.1 Site History

Site 138 includes Buildings 404, 407, and 408. The layout of Site 138 is shown on Figure 3-110.

Building 404 is a one-story 160 ft x 40 ft structure that was constructed in 1906 as a storehouse for sodium nitrate. The building has a gable roof, concrete and brick walls, and is covered with metal siding. The building was modified in the 1950s for use as a scientific laboratory. The laboratory was used for conducting physical research, including bomb testing and pyrometry. A physical-chemical laboratory was located in Building 404 from 1958 to 1975. Building 404 is used as a machine shop and for testing burning propellants.

Building 407 is a one-story 225 ft x 165 ft structure with a concrete foundation, concrete block walls, and a large interior courtyard. Building 407 was constructed in 1942 as an experimental chemistry laboratory, and was subsequently used as an energetics laboratory for propellant manufacturing. According to a 1989/1990 study, a former machine shop was also located in Building 407; however, the exact location of the machine shop within the building is unknown. The last reported use of Building 407 is for electronic testing. Potential waste streams generated at Building 407 include photographic wastes, paints, TCE, spent heavy metals, and empty paint cans.

Building 408 is an 85 ft x 40 ft structure with a structural steel frame encased in concrete, hollow tile infill, and a corrugated metal-covered roof. Building 408 was constructed in 1920 for the experimental loading and nitrating of cottons, linens, and wood pulp for the production of nitrocellulose. Building 408 was modified between 1957 and 1962 for use as a chemical research facility in the experimental pressing of explosives. In 1974, the building was used as a lead azide production facility. A fire in 2001 destroyed most of the building's interior. Building 408 is currently planned for demolition.

#### 3.47.2 Previous Investigations

The 1989 to 1990 study involved sampling and analysis of groundwater from wells (F-PW-410 and F-PW-430 A) and an inspection of buildings and other structures within 500 ft of each well. Well F-PW-430 A is not associated with Site 138. The water samples were analyzed for halogenated compounds and aromatic compounds.

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

Additional groundwater investigations at Site 138 have been conducted and are discussed in detail in the Mid-Valley Groundwater Feasibility Study (ARCADIS 2007).

The 1991 USGS reconnaissance investigation involved a soil gas survey, drive point groundwater sampling, and groundwater flow path analysis. The soil gas survey was performed in the vicinity of water supply well F-PW-410 between July 26, 1990 and August 24, 1990. A total of 47 soil gas samples were collected from 3-4 ft bgs within 500 ft of well F-PW-410 and analyzed for VOCs. Drive point groundwater samples were also collected at multiple depths as part of the investigation. The drive point groundwater sample locations were selected using the soil gas survey results and a total of 21 groundwater samples were collected and analyzed for VOCs. The USGS assessed groundwater flow paths in the vicinity of well F-PW-410 to evaluate how pumping the well influences local groundwater flow.

The Phase I RI (D&M 1998) consisted of thirty-three surface soil, six subsurface soil, three surface water, three sediment, and four groundwater samples. Samples were collected in 1993 and 1994 and analyzed for VOCs, SVOCs, explosives, pesticides/PCBs, cyanide, and metals.

In October 2000, Tank 408A and Tank 408B were removed from the north side of building 408 and closed in accordance with 40 CFR 264 and New Jersey Administrative Code 7:26G. Tank 408A was an underground storage tank constructed of approximately 10 inch thick concrete, and was used as a collection tank for wastes generated from Building 408. The material was drained into the tank via a stainless steel and concrete trough system. Tank 408B was an aboveground storage tank constructed of baffled metal. This tank was used as a neutralization tank for acids produced during manufacturing activities. Soil samples were collected around and beneath each tank center, as well as along the trough system. Chip samples were collected from the walls of Tank 408A. Arsenic, lead, thallium, and RDX were detected at concentrations above LOCs in samples from the Tank 408A area. Lead was detected at concentrations greater than the LOCs in samples collected from the former location of Tank 408B. In July 2001, approximately 18 cubic yards of soil were removed from the former location of Tank 408B. Post-excavation samples were below the LOCs for lead, and the excavation was backfilled to its original grade with certified clean fill. Closure reports for Tank 408A and Tank 408B were submitted to NJDEP in 2001.

The Phase I 2A/3A investigation consisted of sixteen surface soil samples, two subsurface soil samples, and seven sediment samples, collected between September

2000 and April 2001. Surface soil samples were analyzed for PAHs, pesticides, and inorganics. Subsurface soil samples were analyzed for PAHs. Sediment samples were analyzed for explosives and inorganics.

Data available from the PTA database for Site 138 are provided in Appendix A, and historical sampling locations are shown in Figure 3-111.

### 3.47.3 Nature and Extent

Twenty-nine surface soil samples had detections of at least one SVOC at concentrations greater than its respective LOC. The SVOCs detected at Site 138 were: benz(a)anthracene (LOC = 2 mg/kg), benzo(a) pyrene (LOC = 0.2 mg/kg), benzo(b)fluoranthene (LOC = 2 mg/kg), benzo(k)fluoranthene (LOC = 23 mg/kg), dibenz(a,h)anthracene (LOC = 0.2 mg/kg), indeno(1, 2, 3-c,d)pyrene (LOC = 2 mg/kg), and naphthalene (LOC = 17 mg/kg). Maximum concentrations of benz(a)anthracene (100 mg/kg), benzo(b)fluoranthene (200 mg/kg), benzo(k)fluoranthene (90 mg/kg), and indeno(1, 2, 3-c,d)pyrene (70 mg/kg) were detected at location F-SS138-6. Maximum concentrations of benzo(a) pyrene (78 mg/kg) and dibenz(a,h)anthracene (13 mg/kg) were detected at sample location F-138-SS-036. The maximum concentration of naphthalene (20 mg/kg) was detected at sample location F-SS138-9.

The only PCB detected in surface soil in concentrations greater than its LOC (LOC = 1 mg/kg) for surface soil was Aroclor 1260, USAEC LH17, which was detected at a concentration of 1.8 mg/kg in surface soil sample at location F-SS138-10; however, for this same sample location and depth, the Aroclor 1260, USAEC LM25 result was not detected. Two pesticides were identified in surface soil samples in concentrations exceeding their respective LOCs: heptachlor epoxide, USAEC LH 17(LOC = 0.3 mg/kg) was detected at a concentration of 0.64 mg/kg at sample location F-SS138-13, dieldrin, USAEC LH 17 (LOC= 0.2 mg/kg) was detected at a concentration of 0.76 mg/kg at sample location F-SS138-5. Neither of these pesticides for these same sample locations were detected under the USAEC LM25 method. Two metals were detected in concentrations that exceeded the respective LOCs: arsenic (LOC = 19 mg/kg) was detected at sample location F-SS138-10 at a concentration of 20.5 mg/kg, and manganese (LOC = 5900 mg/kg) was detected at a concentration of 8500 mg/kg at sample location F-SS138-6. No other constituents were detected in concentrations greater than their respective LOCs for surface soil.

The only constituents detected in concentrations greater than their respective LOCs in subsurface soils, were PAHs. Concentrations of 1.8 mg/kg benzo(a) pyrene (LOC = 0.2

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

mg/kg), 5.8 mg/kg benzo(b)fluoranthene (LOC = 2 mg/kg), and 2.2 mg/kg indeno(1, 2, 3-c,d)pyrene (LOC = 2 mg/kg) were detected at subsurface soil sample location F-138-SS-035 at a depth of 2-3 ft bgs. Benzo(a)pyrene was also detected at a concentration of 0.23 mg/kg at location F-138-SS-036 at 2-3 ft bgs. No VOCs, explosives, pesticides, or metals were detected in subsurface soil samples at concentrations greater than LOCs.

Sediment samples were collected from a ditch that is north and northwest of Site 138 and leads to GPB. Sediment and surface water impacts in GPB areas south of the Picatinny Lake outlet were evaluated through the Green Pond and Bear Swamp Brooks Focused Feasibility Study (IT 2001) and resulting Record of Decision Green Pond Brook/Bear Swamp Brook (USEPA 2004b). From the samples collected in the vicinity of Site 138, two SVOCs, fluoranthene (LOC = 0.06423 mg/kg) and pyrene (LOC = 0.053 mg/kg), were detected at concentrations of 0.76 mg/kg and 0.86 mg/kg, respectively, at location F-SD138-3. Fluoranthene was also detected at location F-SD138-1 at a concentration of 0.4 mg/kg. Two pesticides were detected in the sediment sample from location F-SD138-1: 1.6 mg/kg 4,4'-DDD (LOC = 0.00354 mg/kg) and 3.2 mg/kg 4,4'-DDT (LOC = 0.00119). Two pesticides were also detected in the sediment sample from location F-SD138-2: 0.02 N mg/kg aldrin, USAEC LH 17 (LOC = 0.002 mg/kg), and the duplicate sample from the same location had a concentration of 0.01 mg/kg 4,4'-DDE, USAEC LH 17 (LOC = 0.00142 mg/kg).

Nine sediment samples had detections of at least one metal above LOCs. Maximum concentrations of beryllium (3.65 mg/kg, LOC = 2 mg/kg) and mercury (27 mg/kg, LOC = 0.249 mg/kg) were detected in the sediment sample from location F-SD138-3. Maximum concentrations of cadmium (3.1 J mg/kg, LOC = 1.7 mg/kg), manganese (2890 mg/kg, LOC = 1673 mg/kg), and zinc (301 mg/kg, LOC = 171 mg/kg) were detected in the sediment sample from location F-138-SD-004. Maximum concentrations of arsenic (23.7 mg/kg, LOC = 16 mg/kg), copper (133 mg/kg, LOC = 28 mg/kg), and silver (6.9 mg/kg, LOC = 1 mg/kg) were detected in sediment samples at location F-318-SD-008. Maximum concentrations of chromium (522 mg/kg, LOC = 37.3 mg/kg) and lead (1060 mg/kg, LOC = 38.8 mg/kg) were detected in sediment samples from location F-SD138-1. No other constituents were detected with concentrations greater than the LOCs in sediment samples.

In surface water samples, which were collected in association with sediment samples, three metals were detected at concentrations greater than the LOC in at least one surface water sample at Site 138. Aluminum (LOC = 190 ug/L) and lead (LOC = 3.2 ug/L) were detected in samples from two locations. The maximum concentration of

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

aluminum (354 ug/L) was in a duplicate sample from location F-SW138-2, and the maximum concentration of lead (13 ug/L) was in a sample from location F-SW138-3. Mercury (0.53 ug/L, LOC = 0.05 ug/L) was also detected at sample location F-SW138-3. Cyanide was detected in a surface water sample from location F-SW138-1 at a concentration of 5.44 ug/L, which exceeded the LOC (5.2 mg/kg). No other constituents were detected in concentrations greater than the LOCs in surface water.

Samples from three groundwater wells at Site 138, F-PW-410, F-138-MW-003, and F-MW138-1, had detections of PCE (LOC = 1 ug/L) and/or TCE (LOC = 1 ug/L) at concentrations which exceeded the LOC. The maximum concentration of both PCE (14 ug/L) and TCE (8 ug/L) were in samples collected at F-MW138-1. The maximum TCE sample from this well was in a sample collected in 1994, and concentrations have decreased in each sample since this time. The most recent sample, in 2003, had a TCE concentration of 1.2 mg/kg. TCE has not been detected at levels greater than the LOC in any soils at this site.

One SVOC, bis(2-ethylhexyl)phthalate (LOC = 3 ug/L), was detected in a groundwater sample from location F-138-GG-001A. RDX (LOC = 2 ug/L) was detected in groundwater samples from four Site 138 groundwater wells. The maximum concentration of RDX, 15 D ug/L, was detected in a sample from location F-138-MW-004, in 1999. The most recent sample from this well, collected in 2008, indicates that the concentration of RDX has decreased to a concentration of 2.66 ug/L.

Nine metals, predominantly naturally occurring constituents, were detected at Site 138 in at least one groundwater sample at concentrations greater than the LOCs. The maximum concentration of 1.65 ug/L beryllium (LOC = 1 ug/L) was detected at location F-PW-410. The maximum concentrations of 29 ug/L lead (LOC = 5 ug/L), 120 ug/L nickel (LOC = 100 ug/L), and 60,200 ug/L sodium (LOC = 50,000 ug/L) were detected at location F-138-MW-003. The maximum concentrations of 27,000 ug/L aluminum (LOC = 200 ug/L), 8.8 ug/L arsenic (LOC = 3 ug/L), 32,400 ug/L iron (LOC = 300 ug/L), and 53 ug/L vanadium (LOC = 37 ug/L) were detected at location F-FGG-04A. The maximum concentration of 1070 ug/L manganese (LOC = 50 ug/L) was detected at location F-MW138-2. Constituents in groundwater at Site 138 are addressed under the Final Feasibility Study, Mid-Valley Groundwater (ARCADIS 2007).

### 3.47.4 Summary of Risk Assessment

#### 3.47.4.1 Human Health

An HHRA was completed for Site 138 receptors and provided previously in the Phase II Remedial Investigation Report. The results of the HHRA calculations at Site 138 are summarized in Table 3-1.

Human health risks under current and reasonable anticipated future use scenarios are:

- Current and Future Industrial/Research Worker (Surface soil): carcinogenic risk number of  $5E-5$ / noncarcinogenic HI of less than 1.
- Current and Future Outdoor Maintenance Worker (Surface Soil): carcinogenic risk of  $4x1E-6$ ; noncarcinogenic HI of less than 1.
- Current and Future Construction/Excavation Worker (Total soil): carcinogenic risk of  $1E-5$ / noncarcinogenic HI of 6.

Additionally, human health risks were calculated for use scenarios not reasonably anticipated and are as follows:

- Current and Future On-Site Youth Visitor (Sediment): noncarcinogenic HI of less than 1.

The estimated reasonable maximum exposure risks for reasonable anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of  $1E-6$  to  $1E-4$ . The estimated noncarcinogenic hazard index for the Construction/Excavation Worker is 6, which exceeds the USEPA's noncancer hazard threshold of 1. The constituent driving the hazard for this scenario is manganese. While the calculated hazard index for the construction/excavation worker exceeds the threshold of 1, the soil exposure point concentration for manganese is less than the USEPA's soil remediation goal for manganese (23,000 mg/kg).

#### 3.47.4.2 Lead Blood Model Results

The current reasonably anticipated future scenarios were reevaluated at this site to reflect the current guidance for model input parameters as presented in Appendix C.

Human health risks associated with lead exposures under current and reasonable anticipated future use scenarios are:

- Current and Future Industrial/Research Worker (Surface Soil): No concern - average lead concentration of 98 mg/kg is less than the calculated PRG of 1,092 mg/kg.
- Current and Future Construction/Excavation Worker (Total Soil): No concern - average lead concentration of 92 mg/kg is less than the calculated PRG of 957 mg/kg.

#### 3.47.4.3 *Ecological*

The results of the Phase I ERA (Dames and Moore 1998) indicated potential risks to receptors with small home ranges and to soil invertebrates. Therefore, additional investigations were conducted in Area F as part of Phase III (Shaw, 2007), including a breeding bird survey, wildlife exposure modeling, a small mammal survey, and a rodent sperm analysis. The results of the food web model indicated EEQs greater than 1 for several inorganic chemicals for the white-footed mouse and the American Robin. However, the small mammal survey, rodent sperm analysis and breeding bird survey all indicated that the populations at the site were comparable to reference. Therefore, the overall weight of evidence at the site is that there are no significant effects on the ecological populations.

#### 3.47.4.4 *Summary of Risks and Hazards*

Based on the risk assessments performed for this site, for current and reasonably anticipated future use:

- The carcinogenic risk is within USEPA's generally acceptable risk range of 1E-4 and 1E-6;
- The noncarcinogenic hazard is less than 1 for the Industrial/Research Worker and Outdoor Maintenance Worker scenarios. The noncarcinogenic hazard is greater than 1 for the Construction/Excavation Worker scenario (HI = 6);
- Lead is not a concern at this site as the average concentrations do not exceed the scenario-specific PRGs; and

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- The overall weight of evidence indicates no significant effects on ecological populations at the site.

The estimated reasonable maximum exposure risks for reasonable anticipated future use exposure scenarios are within USEPA's generally acceptable risk range of 1E-6 to 1E-4. Although the calculated hazard index for the construction/excavation worker exceed USEPA's noncancer hazard threshold of 1 due to manganese, the soil concentrations for manganese is less than the USEPA's soil remediation goal for manganese (23,000 mg/kg). The USEPA and Army agreed as part of the 5-Site Dispute Resolution that soil ARARs will not be required to be attained at Site 138 since USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant that need to be addressed at this site, was not exceeded (USEPA, 2014). Thus although a noncancer hazard was calculated, contaminant concentrations at this site do not present a noncancer hazard that must be actively mitigated. However, to mitigate potential future risks and hazards if released for unrestricted use,

#### **4. Response Action**

The purpose of the FS is to evaluate RAs that will ensure that site conditions remain protective for the current and reasonably anticipated future use.

##### **4.1 Scope of the Response Action**

Site 36 and Site 154 are suitable for unrestricted use because these sites do not pose unacceptable risks to human health and the environment. At Site 122 and 138, the results of the site-specific HHRA indicate that, while there are no unacceptable risks there is an unacceptable hazard due to manganese. Therefore, these sites cannot be released for unrestricted use and are evaluated for a response action. For the remaining 44 sites, the results of the site-specific HHRAs indicate that while there are no unacceptable risks or hazards under the current and reasonably anticipated future use, they cannot be released for unrestricted use and are evaluated for a response action.

##### **4.2 Identification of Applicable or Relevant and Appropriate Requirements**

Because there are no unacceptable risks to human health and the environment at these sites for the current and reasonably anticipated future use no applicable or relevant and appropriate requirements (ARARs) are identified. At the two sites with calculated unacceptable noncancer hazard indices (Sites 122 and 138), the USEPA and Army agreed as part of the 5-Site Dispute Resolution that soil ARARs will not be required to be attained at Sites 122 and 138 since USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant that need to be addressed at these sites, was not exceeded (USEPA, 2014). Thus although a noncancer hazard was calculated, contaminant concentrations at these sites do not present a noncancer hazard that must be actively mitigated and no ARARs are identified

##### **4.3 Remedial Action Objectives**

Remedial action objectives are established to address unacceptable risks. Because there are no unacceptable risks to human health and the environment at these sites for the current and reasonably anticipated future use no remedial action objectives are identified.

**Final 48 Site Feasibility  
Study**

PICA-008, 011, 013, 050,  
071, 075, 091, 107, 108, 122,  
134, 135, 136, 162, 175, 200,  
and 209  
Picatinny Arsenal, New  
Jersey

**4.4 Identification of Contaminants of Concern**

There are no contaminants of concern identified by the risk assessment for these sites.

**4.5 Identification of Cleanup Goals**

There are no clean up goals identified for these sites in the absence of risk and contaminants of concern.

**4.6 Areas of Attainment**

There are no areas of attainment for these sites as there are no remedial action objectives identified. However, with the exception of Sites 36 and 154, which are suitable for unrestricted use, the sites included in this FS have been evaluated for two alternatives: NFA and NFA with Monitoring of Land Use.

**Final 48 Site Feasibility  
Study**

PICA-008, 011, 013, 050,  
071, 075, 091, 107, 108, 122,  
134, 135, 136, 162, 175, 200,  
and 209  
Picatinny Arsenal, New  
Jersey

**5. Identification and Screening of Remedial Technologies**

Engineered remedial technologies are not identified as there are no unacceptable risks to address for these sites.

## **6. Development of Response Action Alternatives**

As noted in the previous sections, none of the sites in this FS pose any unacceptable risk to human health or the environment for the existing and reasonably anticipated land use (military/industrial). At Sites 122 and 138, the USEPA and Army agreed as part of the 5-Site Dispute Resolution that soil ARARs will not be required to be attained at Site 138 since USEPA's soil remediation goal of 23,000 mg/kg for manganese, the only contaminant that need to be addressed at these sites, was not exceeded (USEPA, 2014). Therefore, only two RAs were developed and evaluated in this FS including:

- Alternative 1 – No Further Action; and
- Alternative 2 – No Further Action with Monitoring of Land Use.

Each of these alternatives is described in detail in the following sections.

### **6.1 Alternative 1 – No Further Action**

Under Alternative 1, no corrective action of any kind would be employed. Although there are no unacceptable risks for the existing or reasonably anticipated future land use, the NFA Alternative would not control changes in land use that may lead to unacceptable risks should land use change to residential or other uses inconsistent with the risk assessment assumptions. It should be noted, however, that unrestricted use is not a reasonably anticipated future use for any of these sites. There is no cost associated with this alternative.

### **6.2 Alternative 2 – No Further Action with Monitoring of Land Use**

Under Alternative 2, existing controls will be monitored and maintained to ensure protection of human health and prevent unrestricted use. Picatinny has controls in place as components of regular facility operations, which prevent unrestricted use, including: Picatinny access regulations; Picatinny safety program; Army military construction program development and execution; site clearance/soil management procedures; munitions and explosives of concern clearance procedures; Picatinny Installation Master Plan environmental notations, which includes the Picatinny Geographic Information System (GIS or EPRISM) Database that shows the boundaries of each site and any land use restrictions; and procedures followed by the Environmental Directorate of Public Works of the Picatinny Garrison to ensure environmental compliance for construction and other projects. An example of these

procedures includes the use of the Picatinny Environmental Management System and its corresponding database. In addition, as noted above, Picatinny Arsenal also has an existing CEA to address the minor, isolated concentrations of constituents that are greater than screening levels in groundwater. Under the CERCLA/NCP process, the “No Further Action” response is considered to be protective of human health and the environment. To ensure the existing land use remains intact, the Army will conduct annual monitoring. Sites will be visited each year to monitor existing land use, and the Picatinny Master Plan will be reviewed to identify planned future land uses for the sites. The physical site inspection, photographs, and review of land use will be summarized and certified to the USEPA annually. The certification will state that all sites remain military/industrial, that existing controls which prevent unrestricted use remain in place and the selected No Further Action remedy remains protective of human health and the environment. CERCLA Five-Year Reviews will be performed and summarize the results of the monitoring certifying that land use at these sites remained protective of human health. The Army will also notify the USEPA 45 days in advance of any proposed land use changes that are inconsistent with the risk assessment assumptions (military industrial land use). If future land use changes and additional response actions are required to address a risk associated with that land use change, any dispute regarding the extent or scope of that response action will be settled between the USEPA and the Army under the dispute resolution clause of the FFA.

## **7. Evaluation of Remedial Alternatives**

This section presents an analysis of both remedial action alternatives developed in previous sections. These analyses are intended to aid in the selection of an RA that best satisfies the criteria identified in the NCP (USEPA 1990) for sites included in this FS.

### **7.1 Evaluation Criteria**

Section 300.430(e) of the NCP lists seven criteria against which each RA must be assessed. The first two criteria are threshold criteria that must be met by each alternative. The next five criteria are the primary balancing criteria upon which the analysis is based. The final two criteria are referred to as modifying criteria and are applied after the subsequent public comment period to evaluate state and community acceptance. The acceptability or performance of each RA against the criteria is evaluated individually so that relative strengths and weaknesses may be identified.

The two threshold criteria are:

## Final 48 Site Feasibility Study

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

- Protection of human health and the environment; and
- Compliance with ARARs.

The five primary balancing criteria upon which the analysis is based on are:

- Long-term effectiveness and permanence;
- Reduction of toxicity, mobility, or volume through treatment;
- Short-term effectiveness;
- Implementability; and
- Cost.

The two modifying criteria will be evaluated following comments on the Proposed Plan and will be described in the ROD. The modifying criteria are not addressed in this FS. These criteria are:

- State acceptance; and
- Community acceptance.

### 7.1.1 Overall Protection of Human Health and the Environment

This criterion addresses the extent and manner in which the RA achieves protection of human health and the environment over time. Protection of human health and the environment is met if each human health and ecological exposure pathway identified in the risk assessment as potentially resulting in adverse effects is eliminated, reduced to an acceptable level, or controlled through treatment or engineering and land use controls. Site use restrictions after remediation are also considered under this criterion.

### 7.1.2 Compliance with ARARs

This criterion addresses whether the RA complies with ARARs or information to-be-considered. There are no unacceptable risks to human health or the environment, so there is no trigger for an ARAR analysis.

### 7.1.3 Long-term Effectiveness and Permanence

The long-term reliability and effectiveness criterion addresses the degree, extent, and manner in which the RA continues to protect human health and the environment in terms of residual risk remaining at the site after the corrective action objectives have been met. This criterion considers the residual contamination following completion of the actions, expected duration of the response action, and the degree of controls required to ensure protectiveness of the response action.

### 7.1.4 Reduction of Toxicity, Mobility, or Volume of Wastes

This criterion relates to the extent to which RAs permanently reduce the toxicity, mobility, and volume of contaminants present at the site. Factors for this criterion include the degree of permanence of the remedial action, the amount of hazardous materials destroyed, and the type and quantity of residual contamination remaining after treatment.

### 7.1.5 Short-Term Effectiveness

Short-term effectiveness addresses the effects of the RA during construction and implementation until the corrective action objectives are met. This criterion considers the protection of the community and workers, including the air-quality effects and hazards from excavation, transportation, and on-site treatment. In addition, the expected length of time for completion of the remedial action is considered.

### 7.1.6 Implementability

The technical and administrative feasibility of implementing each RA and the availability of services and materials are addressed by this criterion. This criterion also considers the degree of coordination required by the regulatory agencies, successful implementation of the remedial action at similar sites, and research to realistically predict field implementability.

### 7.1.7 Cost

This criterion addresses the capital costs, the operation and maintenance costs, and the present worth analysis of costs anticipated for the implementation of the response action. Capital costs are divided into direct costs (construction) and indirect costs (non-construction and overhead). Direct capital costs include construction, equipment, land

and site development, relocation, and disposal costs. Indirect capital costs include engineering expenses, legal fees, license or permit costs, start-up costs, and contingency allowances. Operation and maintenance costs consist of costs associated with post construction activities necessary to properly operate, maintain, and monitor a given response action.

A present-worth cost was developed for Alternative 2—No Further Action with Monitoring of Land Use. The opinions of probable cost presented in this report were prepared with an anticipated accuracy range of +50 to -30 percent.

## **7.2 Individual Analysis of Alternatives**

This section provides detailed analysis of each RA presented in previous sections as applied to the evaluation criteria.

### **7.2.1 Alternative 1 – No Further Action**

According to the NCP, the level of protectiveness achieved must be compared to the required expenditure of time and materials as an integral portion of the remedy selection process. The No Further Action alternative serves as a viable alternative for the sites within this FS, but also serves as a baseline by which to compare the effectiveness of the other potential alternative. In this alternative, no remedial actions would be performed. No efforts would be undertaken to monitor future site use.

- Overall Protection of Human Health and the Environment: Because there are no unacceptable risks or hazards at these sites to human health and the environment; and the USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard, the no further action alternative is protective for current site use. However, with the exception of Site 36 and Site 154, there are unacceptable human health risks and/or hazards associated with the hypothetical residential use at these sites. This alternative does not include a means to control land use and ensure that site usage remains consistent with the assumptions of the risk assessments.
- Compliance with ARARs: There are no unacceptable risks/hazards for the current and reasonably anticipated future use at these sites. The USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard, and soil ARARs will not be required to be attained since USEPA's soil

remediation goal of 23,000 mg/kg was not exceeded. Therefore, ARARs are not triggered and do not apply to this alternative.

- Long-Term Effectiveness and Permanence: For current site use, the NFA alternative is effective and permanent as there are no unacceptable risks or hazards to human health and the environment at these sites and the USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard; however, there are no controls for changes in site use in the future that may result in unacceptable human health risk.
- Reduction of Toxicity, Mobility, and Volume of Waste: This alternative does not employ any treatment that would reduce the toxicity, mobility, or volume of COCs; however, as noted, for reasonably anticipated future land use, the current conditions do not pose unacceptable risks/hazards and there are, therefore, no risks to mitigate through an active remedial action.
- Short-Term Effectiveness: Implementation of this alternative does not pose any additional risks to the community, the workers, or the environment since there are no remedial activities associated with it.
- Implementability: The no action alternative does not include any actions to implement.
- Cost: There are no present worth or capital costs for the NFA Alternative because there would be no action taken.

#### 7.2.2 Alternative 2 – No Further Action with Monitoring of Land Use

In this alternative, no remedial actions would be performed. No efforts would be undertaken to contain, remove, or treat any contaminated areas at the site. However, the site would be monitored annually to ensure existing controls at Picatinny are properly maintained and to document any changes to land use that may result in an unacceptable human health risk or hazard through change of site use to residential.

- Overall Protection of Human Health and the Environment: Because there are no unacceptable risks or hazards at these sites to human health and the environment; and the USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard, the no further action alternative is protective for current site use. However, with the exception of Site 36 and Site 154,

there are unacceptable human health risks and/or hazards associated with the hypothetical residential use of these sites. The NFA with Monitoring of Land Use alternative provides control of future unrestricted exposure through maintaining existing site controls, controlling land use, and providing annual land use certification reports to the USEPA and NJDEP.

- Compliance with ARARs: There are no unacceptable risks/hazards for the current and reasonably anticipated future use at these sites. The USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard, and soil ARARs will not be required to be attained since USEPA's soil remediation goal of 23,000 mg/kg was not exceeded. Therefore, ARARs are not triggered and do not apply to this alternative.
- Long-Term Effectiveness and Permanence: For current site use, the NFA with Monitoring of Land Use alternative is effective and permanent as there are no unacceptable risks or hazards to human health and the environment at these sites; and the USEPA and Army have agreed that manganese at Sites 122 and 138 does not pose an unacceptable hazard. Annual monitoring and certification of land use to the USEPA and NJDEP will effectively control and restrict future changes in land use that could result in unacceptable human health risks and hazards.
- Reduction of Toxicity, Mobility, and Volume of Waste: This alternative does not employ any treatment that would reduce the toxicity, mobility, or volume of COCs; however, as noted, for reasonably anticipated future land use, the current conditions do not pose unacceptable risks/hazards and there are, therefore, no risks to mitigate through an active remedial action.
- Short-Term Effectiveness: Implementation of this alternative does not pose any additional risks to the community, the workers, or the environment since there are no remedial activities associated with it.
- Implementability: There are no implementability concerns posed by this option.
- Cost: The costs associated with the implementation of this alternative are summarized in Table 7-1, and the detailed assumptions are presented in Appendix D. The costs associated with the implementation of monitoring are based on the best available information regarding the anticipated scope of the RA per site. The projected present-worth cost of the alternative is \$272,000.

### **7.3 Comparative Analysis of Remedial Alternatives**

This section provides a comparative analysis of the expected performance of each alternative relative to the other alternatives to identify their respective advantages and disadvantages.

#### **7.3.1 Overall Protection of Human Health and the Environment**

Alternatives 1 and 2 are both protective of human health and the environment based upon the results of the risk assessments for reasonably anticipated uses of the sites. Alternative 1, however, does not provide any assurance that the existing controls or land uses will remain intact. Therefore, although Alternative 1 would be protective for Site 36 and Site 154, it would not provide controls on future changes of land use at the other 46 sites. Alternative 2 includes an aspect of annual monitoring of land use, which ensures that existing controls and land uses remain consistent with the expected future use (military/industrial) and would be applicable to the 46 sites that cannot be released for unrestricted use.

##### *7.3.1.1 Compliance with ARARs*

There are no unacceptable risks/hazards therefore ARARs are not triggered and do not apply for either alternative.

##### *7.3.1.2 Long-Term Effectiveness and Permanence*

Because the risk results indicate there are no unacceptable risks at these sites, both alternatives provide long-term effectiveness and permanence. Alternative 1, as noted previously, does not provide means by which to ensure existing controls and land uses remain military/industrial in nature. Therefore, Alternative 1 would not provide adequate effectiveness for sites other than Site 36 and Site 154. Alternative 2 – NFA with Monitoring of Land Use is effective in the long-term for the remaining sites because annual monitoring ensures that existing controls and land uses remain consistent with the expected future use (military/industrial).

##### *7.3.1.3 Reduction of Toxicity, Mobility, or Volume of Wastes*

Neither alternative employs any treatment that would reduce the toxicity, mobility, or volume of COCs; however, as noted, for reasonably anticipated future land use, the

**Final 48 Site Feasibility Study**

PICA-008, 011, 013, 050, 071, 075, 091, 107, 108, 122, 134, 135, 136, 162, 175, 200, and 209  
Picatinny Arsenal, New Jersey

current conditions do not pose unacceptable risks/hazards and there are, therefore, no risks to mitigate through an active remedial action.

*7.3.1.4 Short-Term Effectiveness*

Implementation either alternative does not pose any additional risks to the community, the workers, or the environment since there are no remedial activities associated with it.

*7.3.1.5 Implementability*

There are no issues associated with implementing either alternative.

*7.3.1.6 Cost*

There is no cost associated with Alternative 1. Costs associated with Alternative 2 are minimal.

	Sediment	Future	Child Resident	5E-04	Benzo(a)pyrene	10	Iron	

**Notes:**

NR - Not relevant. Cancer risk drivers not present or risk is less than the generally acceptable risk range of 1E-4 to 1E-6.

NC - No cancer risk calculated because none of the constituents present are considered carcinogenic.

NE - Not evaluated

NH - No noncarcinogenic hazard because hazard index does not exceed 1.

Shaded rows are not reasonably anticipated current/future use of the site or the shaded media are addressed in a separate document.

\*The HI for each target organ/effect is less than or equal to one. This indicates that adverse noncancer effects are not expected to occur.

**Bold type = concentration exceeds the 2013 Non-Residential RSL at 1x10-4 Target Cancer Risk or HI of 1.**

*Italic type = concentration exceeds 2013 Residential RSL at 1x10-4 Target Cancer Risk or HI of 1.*

Endosulfan was used as a surrogate for Endosulfan I

Chromium III was used as a surrogate for Chromium

a = the associated laboratory blank data was not reported for concentrations less than the sample quantitation limit; therefore the detected sample concentration should be considered suspect.

b = background value for arsenic at Picatinny Arsenal is 9.23 mg/kg.

c = Evaluated as Trivalent chromium (Cr+3)

d = Evaluated as Hexavalent chromium (Cr+6)

e = RSL value listed is for chlordane

J = concentration should be considered estimated.

NA = Not Available

\*\*RSL column Notes:

1) RSLs updated November 2013 and available at <http://www.epa.gov/region9/superfund/prg/>

2) RSLs protective of noncarcinogenic effects reflect a hazard index of 1

3) NA = No RSL available.

4) Manganese RSL is not based on the manganese reference dose as listed on IRIS. USEPA has adjusted the IRIS reference dose for use in deriving conservative RSLs.

5) TCR = Target Cancer Risk; HI = Hazard Index

6) The RSLs for the following compounds are not based on toxicity data presented in IRIS but from other sources (provisional toxicity or state-derived values): aluminum, hexavalent chromium, cobalt, copper, iron, and nickel.
