2-Butanone	78-93-3	ug/L	< 6.4 U		< 6.4 U
2-Hexanone	591-78-6	ug/L	< 3.6 U		< 3.6 U
4-Methyl-2-pentanone (MIBK)	108-10-1	ug/L	< 3 U		< 3 U
Acetone	67-64-1	ug/L	< 13 U		< 13 U
Acetonitrile	75-05-8	ug/L	< 200 U		< 200 U
Benzene	71-43-2	ug/L	< 0.5 U		< 0.5 U
Bromodichloromethane	75-27-4	ug/L	< 0.59 U		< 0.59 U
Bromoform	75-25-2	ug/L	< 2.6 U		< 2.6 U
Bromomethane	74-83-9	ug/L	< 5.8 U		< 5.8 U
Carbon disulfide	75-15-0	ug/L	< 0.5 U		< 0.5 U
Carbon tetrachloride	56-23-5	ug/L	< 0.58 U		< 0.58 U
Chlorobenzene	108-90-7	ug/L	< 0.5 U		< 0.5 U
Chloroethane	75-00-3	ug/L	< 1.9 U		< 1.9 U
Chloroform	67-66-3	ug/L	< 0.5 U		< 0.5 U
Chloromethane	74-87-3	ug/L	< 3.2 U		< 3.2 U
cis-1,3-Dichloropropene	10061-01-5	ug/L	< 0.58 U		< 0.58 U
Dibromochloromethane	124-48-1	ug/L	< 0.67 U		< 0.67 U
Dichlorodifluoromethane	75-71-8	ug/L	< 6.9 U		< 6.9 U
Ethanol	64-17-5	ug/L	< 2000 U		< 2000 U
Ethyl benzene	100-41-4	ug/L	< 0.5 U		< 0.5 U
Isopropanol	67-63-0	ug/L	< 400 U		< 400 U
Methylene chloride	75-09-2	ug/L	< 2.3 U		< 2.3 U
Styrene	100-42-5	ug/L	< 0.5 U		< 0.5 U
tert-Butylalcohol	75-65-0	ug/L	< 500 U		< 500 U
Tetrachloroethene	127-18-4	ug/L	< 1.6 U		< 1.6 U
Toluene	108-88-3	ug/L	< 0.5 U		< 0.5 U
trans-1,3-Dichloropropene	10061-02-6	ug/L	< 0.7 U		< 0.7 U
Trichloroethene	79-01-6	ug/L	< 0.5 U		< 0.5 U
Trichlorofluoromethane	75-69-4	ug/L	< 1.4 U		< 1.4 U
Vinyl acetate	108-05-4	ug/L	< 8.3 U		< 8.3 U
Vinyl chloride	75-01-4	ug/L	< 2.6 U		< 2.6 U
Xylenes	1330-20-7	ug/L	< 0.84 U		< 0.84 U
<b>WetChem</b>					
Ammonia	7664-41-7	ug/L	< 60 U		< 60 U
Chloride	16887-00-6	ug/L	69000		72000
Cyanide	57-12-5	ug/L	< 2.5 U		< 2.5 U
Fluoride	16984-48-8	ug/L	< 1230 U		< 1230 U
Nitrate/Nitrite	Nitrate/Nitrite	ug/L	950		1100
Phosphate	14265-44-2	ug/L	29.1		26.6
Sulfate	14808-79-8	ug/L	30000		24000
Sulfide	18496-25-8	ug/L	< 50 U		< 50 U

ADI = Allowable Daily Intake

ARAR = Applicable or Relevant and Appropriate Requirement

C/N = Carcinogenic or noncarcinogenic according to USEPA (2003).

RSL = USEPA Regional Screening Level

ND = Not detected

NJNR = New Jersey Non-residential

SC = Screening Criterion/Criteria

TBC = To Be Considered

— = No value available

(a) Note that chemicals without guidance values are presented in this table.

(b) NJDEP Soil Remediation Standards (June 2, 2008).

(c) USEPA Regional Screening levels (RSL)(2008). Industrial exposures are based on 250 days, while residential exposures are based on 350 days. A hazard index of 1 was used for noncarcinogenic RSLs.

(d) Surface and subsurface soil background values are from the PTA Background Study Report and are the lower of the maximum concentration or the mean plus three standard deviations for a given chemical.

(e) The NJDEP Non-residential Soil Remediation Standard is the primary comparison criteria for surface and subsurface soil. In the absence of State Remediation Standard, the USEPA Regional Screening Levels (RSLs) will be used unless Site background levels are higher than the RSLs. Residential values are presented for informational purposes only.

(f) NJDEP values are for 1,2-Dichloroethene (mixed polymer).

(g) NJDEP values are for cis- and trans-1,3-dichloropropene. The RSL value for 1,3-Dichloropropene was used.

(h) The RSL values for pyrene were used for noncarcinogenic polycyclic aromatic hydrocarbons (PAHs) lacking criteria.

**Table B-1  
Screening Criteria for Picatinny Arsenal Surface and Subsurface Soil (a)  
(mg/kg)**

Chemical	Soil Remediation Standards (b)		USEPA Regional Screening Level (c)					Surface Soil Background Value (d)	Subsurface Soil Background Value (d)	Screening Criteria	
			Industrial		Residential					Surface and Subsurface Soil	
	Residential	Non-residential	Non-carcinogen	Carcinogen 1x10 <sup>-6</sup>	Non-carcinogen	Carcinogen 1x10 <sup>-6</sup>	C/N			Site Characterization/ Prioritization	
										SC (e)	SC Chosen

- (i) Values based on 1,4-dichlorobenzene.
- (j) The NJDEP values for gamma-BHC were used.
- (k) The RSL value for gamma-BHC was used.
- (l) The NJNR values for chlordane were used.
- (m) The impact to groundwater and RSL values for endosulfan were used.
- (n) The values for endrin were used.
- (o) NJDEP values for PCBs were used.
- (p) New Jersey Impact to Groundwater value for 2,4-/2,6-mixture of dinitrotoluene was used.
- (q) NJDEP Residential and Non-residential Remediation Standard values were developed for PTA by NJDEP.
- (r) This note removed/no longer applicable.
- (s) Values are based on 2-Nitrotoluene.
- (t) USEPA RSL values for PCDD/PCDF congeners were derived using toxicity criterion for 2,3,7,8-TCDD modified by toxic equivalency factors (TEFs) (USEPA 2000).
- (u) The food RSL value for cadmium was used.
- (v) The value presented in the RSL column is an allowable daily intake (ADI) level for essential human nutrients.
- (w) The RSL value for chromium VI was used.
- (x) For Lead and Lead compounds
- (y) The non-food RSL value for manganese was used.
- (z) The RSL value for methyl mercury was used.
- (aa) The RSL value for fluorine was used.
- (ab) The values for radiological parameters are in units of pCi/g.
- (ac) Uranium units are mg/kg. The RSL for the most conservative soluble salts was used.

ADI = Allowable Daily Intake

ARAR = Applicable or Relevant and Appropriate Requirement

ER-L = Effect Range-Low

ISQG = Interim Sediment Quality Guideline

ND = Not detected.

NYSDEC = New York State Department of Environmental Conservation Sediment Criteria

RSL = USEPA Regional Screening Level

SC = Screening Criterion/Criteria

SQB = Sediment Quality Benchmark

TBC = To Be Considered

— = No value available.

(a) Note that chemicals without guidance values are presented in this table.

(b) USEPA (2008) Industrial exposures are based on 250 days/year. A hazard index of 1 was used for noncarcinogenic RSLs.

(c) USEPA (2008) Residential exposures are based on 350 days/year. Residential values are presented for informational purposes only. A hazard index of 1 was used for noncarcinogenic RBCs.

(d) NJDEP Soil Remediation Standards (2008).

(e) Sediment background values are from the PTA Background Study Report and are the lower of the maximum concentration or the mean plus three standard deviations for a given chemical.

(f) The selection order for the sediment SC is as follows: 1) the lower of the ISQGs, NY Sediment Criteria, and SQBs (the lower of the SQB and threshold effect concentration [TEC] was selected from the ORNL, 1997 publication); 2) in their absence ER-Ls from NJDEP, 1998 (Tables 2 and 3) were used; 3) in the absence of ER-Ls, the lower of RSL (industrial soil) and New Jersey Non-residential (NJNR) soil remediation standards were used.

(g) The final SC value is the higher of the SC and sediment background value. If no SC was available, no final SC is presented.

(h) The NJNR value for cis-1,2-dichloroethene was used.

(i) SQB value for 1,2-Dichloroethene (total) was used.

(j) The values for 1,3-Dichloropropene were used.

(k) The RSL and NJNR values for pyrene were used for noncarcinogenic polycyclic aromatic hydrocarbons (PAHs) lacking criteria.

(l) TEC value was used from ORNL.

(m) SQB value for benzo(b,k)fluoranthene was used.

(n) The RSL and NJNR values for 1,4-dichlorobenzene were used.

**Table B-2  
Screening Criteria for Picatinny Arsenal Sediment (a)  
(mg/kg)**

Chemical								Sediment Background Value (e)	Screening Criteria			
	ISQGs	New York Sediment Criteria	SQBs	ER-Ls	USEPA Regional Screening Levels, industrial soil (b)		NJDEP Soil Remediation Standards (d)		Site Characterization/Prioritization		Final SC (Higher of SC and Background Value [g] )	Final SC Chosen
	CCME 2002	NYSDEC 1999	ORNL 1997	NJDEP 1998	Non-carcinogen	Carcinogen 1x10 <sup>-6</sup>	Nonresidential		SC(f)	SC Chosen		

- (o) NYSDEC value for dichlorobenzenes was used.
- (p) NYSDEC value for total unchlorinated phenols.
- (q) NYSDEC value for trichlorobenzene was used.
- (r) The ISQG value for gamma-BHC was used. The SQB for BHC (other) was used.
- (s) The ER-L, RSL, and NJNR values for gamma-BHC were used.
- (t) The values for chlordane were used.
- (u) The ER-L for DDT (total) was used.
- (v) The values for endosulfan were used.
- (w) The values for endrin were used.
- (x) The ISQG and ER-L values for heptachlor epoxide were used.
- (y) The SQB for heptachlor was used.
- (z) The ISQG for total PCBs was used.
- (aa) The NYSDEC and NJNR values for total PCBs were used.
- (ab) The NJDEP value for total PCBs was used.
- (ac) NJNR values were developed for PTA by NJDEP.
- (ad) The RSL value for aminodinitrotoluenes was used.
- (ae) USEPA RSL values for PCDD/PCDF congeners were derived using toxicity criterion for 2,3,7,8-TCDD modified by toxic equivalency factors (TEFs) for humans (USEPA, 2000). ISQG values were modified using TEFs for fish (Van den Berg et al., 1998).
- (af) The food RSL value for cadmium was used.
- (ag) The value presented in the RSL column is an allowable daily intake (ADI) level for essential human nutrients.
- (ah) The RSLvalue for chromium VI was used.
- (ai) Lead does not have an RSL, however the 400 mg/kg residential soil screening level for children (USEPA 1994) is presented in the RSL column.
- (aj) The non-food RSL value for manganese was used.
- (ak) The RSL value for methyl mercury was used.
- (al) The RSL value for fluorine was used.
- (am) The background value for nitrate/nitrite was used.
- (an) The background value is the maximum detected concentration.
- (ao) The values for radiological parameters are in units of pCi/g.
- (ap) Uranium units are mg/kg. The RSL for the most conservative soluble salts was used.

ADI = Allowable Daily Intake  
ARAR = Applicable or Relevant and Appropriate Requirement  
C/N = Carcinogenic or noncarcinogenic according to USEPA (2008).  
ND = Not detected.  
SC = Screening Criterion/Criteria  
SWQC = Surface Water Quality Criteria

**Table B-3**  
**Screening Criteria for Picatinny Arsenal Surface Water (a)**  
**(ug/L)**

Chemical	USEPA Water Quality Criteria (b)							N.J. Surface Water Quality Criteria (FW-2) (c)	USEPA Residential Tap Water RSLs (d)			Surface Water Background Value (e)	Screening Criteria			
	Acute	Chronic	Human Health Risk for		SWQC	Non-carcinogen	Carcinogen 1X10 <sup>-6</sup>		C/N	Site Characterization / Prioritization			Final SC (Higher of SC and Background value when is available [g])			
			Water & Organisms	Organisms Only						SC (f)	SC Chosen		Final SC	Final SC Chosen		

TBC = To Be Considered

TWRSL = USEPA Tap Water Regional Screening Level

— = No value available.

(a) Note that chemicals without any guidance values are presented in this table.

(b) USEPA (2006). National Recommended Water Quality Criteria. These water quality criteria are the USEPA's current recommended criteria, reflecting the latest scientific knowledge as required by Section 304(a)(1) of the Clean Water Act. The acute criteria are based on maximum exposure concentrations and the chronic criteria are based on a continuous concentration.

(c) NJDEP (2008). Surface water quality criteria fall into one of six categories: acute aquatic life criteria, chronic aquatic life criteria, noncarcinogenic effects-based human health criteria, carcinogenic effects-based human health criteria, toxic substances considered to be possible human carcinogens criteria, and organoleptic effects-based criteria. In most cases, State values are only available for one of the six categories, as a result, only the lowest of the available State values is presented in this table. The surface water at Picatinny is classified as FW2-NT (general surface water classified as nontrout fresh water).

N.J. Surface Water Quality Criteria notes:

[a] FW2 value represents acute aquatic life protection criterion generally expressed as a one hour average.

[c] FW2 value represents chronic aquatic life protection criterion expressed as a four day average.

[h] FW2 value is a noncarcinogenic effect-based human health criterion expressed as a 30-day average.

[hc] FW2 value is a carcinogenic effect-based human health criterion expressed as a 70-year average.

(d) USEPA (2008). USEPA Regional Screening Levels for consumption of tap water and inhalation while showering. These values are residential exposures based on 350 days/year. A hazard index of 1 was used for noncarcinogenic RSLs.

(e) Surface water background values are from the PTA Background Study Report and are the lower of the maximum concentration or the mean plus three standard deviations for a given chemical.

(f) SC is the NJ Surface Water Quality Criteria where applicable. USEPA Water Quality Criteria used only when New Jersey Standards are not applicable. Only in the absence of water quality criteria is the USEPA Tap Water (10<sup>-6</sup>) RSL selected as the SC.

(g) The final SC value is the higher of the SC and surface water background value. If no SC was available, no final SC was presented.

(h) N.J. Surface Water Quality Criteria value for 1,2-dichloroethane.

(i) N.J. Surface Water Quality Criteria and USEPA Water Quality Criteria for trans-1,2-dichloroethene.

(j) USEPA Water Quality Criteria and N.J. Surface Water Quality Criteria for 1,3-dichloropropene.

(k) Criteria for pyrene were used for noncarcinogenic polycyclic aromatic hydrocarbons (PAHs) lacking criteria.

(l) Criteria for 1,4-dichlorobenzene were used for dichlorobenzenes and RSLs for 1,4-dichlorobenzene was used for 1,3-dichlorobenzene.

(m) Criteria is pH dependent. A pH of 7.8 was used for USEPA Water Quality Criteria and a pH of 7.5 was used for N.J. Surface Water Quality Criteria.

(n) Criteria for gamma-BHC were used.

(o) Criteria for chlordane were used.

(p) USEPA RSL value for endosulfan.

(q) Aquatic USEPA Water Quality Criteria value was derived from data for endosulfan.

(r) N.J. Surface Water Quality Criteria value for endosulfan (alpha and beta).

(s) Criteria for endrin were used for endrin ketone and the USEPA RSL for endrin was used for endrin aldehyde.

(t) USEPA Water Quality Criteria value was derived from data for heptachlor.

(u) Aquatic USEPA Water Quality Criteria for total PCBs.

(v) This note removed/no longer applicable.

(w) USEPA RSL values for PCDD/PCDF congeners were derived using toxicity criterion for 2,3,7,8-TCDD modified by toxic equivalency factors (TEFs) (USEPA 2000).

(x) USEPA Water Quality Criteria values based on a pH range of 6.5 to 9.0 and are expressed in terms of total recoverable metal in the water column.

(y) USEPA Water Quality criteria was converted to total metal in the water column from a dissolved value using a conversion factor in accordance with Appendix A of USEPA (2002).

(z) Criteria values are for arsenic III.

(aa) USEPA Water Quality Criteria refers to the inorganic form only.

(ab) USEPA Water Quality Criteria for this metal assume a hardness concentration of 100 mg/L in the water column.

(ac) The value presented in the RSL column is an allowable daily intake (ADI) level for essential human nutrients.

(ad) Values for chromium VI were used.

(ae) This recommended water quality criterion is expressed as µg free cyanide (as CN/L).

**Table B-3  
Screening Criteria for Picatinny Arsenal Surface Water (a)  
(ug/L)**

Chemical	USEPA Water Quality Criteria (b)							N.J. Surface Water Quality Criteria (FW-2) (c)	USEPA Residential Tap Water RSLs (d)			Surface Water Background Value (e)	Screening Criteria			
	Acute	Chronic	Human Health Risk for		SWQC	Non-carcinogen	Carcinogen 1X10 <sup>-6</sup>		C/N	Site Characterization / Prioritization			Final SC (Higher of SC and Background value when is available [g])			
			Water & Organisms	Organisms Only						SC (f)	SC Chosen		Final SC	Final SC Chosen		

(af) Lead does not have an RSL, however the 15 ug/L action level (USEPA 1996a) is presented in the RSL column.

(ag) The non-food RSL value for manganese was used.

(ah) The RSL value for methyl mercury was used.

(ai) These recommended water quality criteria were derived from data for inorganic mercury (II).

(aj) This recommended water quality criterion was expressed in terms of total recoverable metal in the water column.

(ak) NJ value was based on typical pH ranges and temperature ranges measured at surface water sampling locations throughout PTA, the following range of un-ionized ammonia concentrations were calculated as site-specific surface water quality criteria (SWQC) for the FW2-NT surface water classification at PTA. For summer, the acute SWQC range from 339 ug/L to 1,277 ug/L; the chronic SWQC range from 91 ug/L to 343 ug/L. For winter, the acute SWQC range from 756 ug/L to 3,239 ug/L; the chronic SWQC range from 195 ug/L to 838 ug/L.

(al) USEPA RSL for fluorine.

(am) The background value for nitrate/nitrite was used.

(an) Value for sulfide-hydrogen sulfide was used.

(ao) The values for radiological parameters are in units of pCi/L.

(ap) Uranium is in units of ug/L. The RSL for the most conservative soluble salts was used.

(aq) Asbestos units are fibers/L.

(ar) N.J. Surface Water Quality Criteria assume fibers longer than 10 micrometers.

ADI = Allowable Daily Intake

AL = Action Level

ARAR = Applicable or Relevant and Appropriate Requirement

C/N = Carcinogenic or noncarcinogenic according to USEPA (2003).

HA = Health Advisory

MCL = Maximum Contaminant Level

MCLG = Maximum Contaminant Level Goal

NJMCL = New Jersey Maximum Contaminant Level (2002)

PQL = Practical Quantitation Limit

SC = Screening Criterion/Criteria

TBC = To Be Considered

TWRSL = USEPA Tap Water Regional Screening Level

— = No value available.

(a) Note that chemicals without guidance values are presented in this table.

(b) USEPA Drinking Water Standards and Health Advisories (Summer 2006) Publication #EPA 822-R-06-013

(c) NJDEP(2005).

(d) USEPA (2008). Residential exposure based on ingestion of tap water and inhalation while showering for 350 days. A hazard index of 1 was used for noncarcinogenic RSLs.

(e) SC for PTA groundwater are based on the lower of the following values: (1) Federal MCLs, (2) New Jersey State MCLs,

(3) New Jersey Groundwater Quality Criteria (QC) or PQLs (whichever is higher), and (4) any non-zero Federal MCLGs. If none of the above criteria are available, the groundwater SC will be based on the lower of the following: Federal Drinking Water Health Advisories or USEPA Tap Water RSLs.

(f) Federal values are based on trihatomethanes.

**Table B-4  
Screening Criteria for Picatinny Arsenal Groundwater (a)  
(ug/L)**

Chemical	Screening Criteria									
	Federal Drinking Water Standards (b)		New Jersey Drinking Water	New Jersey Groundwater (c)		Federal Drinking Water Health Advisories Life time (b)	USEPA Tap Water Regional Screening Levels (d)			Site Characterization/ Prioritization
	MCL	MCLG	NJMCL	Quality Criteria	NJPQL	HA	Non-carcinogen	Carcinogen 1x 10 <sup>-6</sup>	C/N	SC (e)

- (g) The QC value for cis-1,2-dichloroethene was used.
- (h) The RSL value for 1,3-dichloropropene was used.
- (i) The values for pyrene were used for noncarcinogenic polycyclic aromatic hydrocarbons (PAHs) lacking RBCs and NJ criteria.
- (j) Values for 1,4-dichlorobenzene were used.
- (k) The HA value for gamma-BHC (lindane) was used.
- (l) The QC and RSL values for gamma-BHC were used.
- (m) The values for chlordane were used for NJ criteria and RSLs.
- (n) The RSL value for endosulfan was used.
- (o) The value for endrin was used for NJ criteria, HAs and RSLs.
- (p) The Federal MCLs and NJ values for PCBs were used.
- (q) The value for 2,4-dinitrotoluene and 2,6-dinitrotoluene mixture was used for the QC and the PQL value for mixed dinitrotoluene was used for 2,4-dinitrotoluene.
- (r) The RSL value for aminodinitrotoluenes was used.
- (s) USEPA RSL values for PCDD/PCDF congeners were derived using toxicity criterion for 2,3,7,8-TCDD modified by toxic equivalency factors (TEFs) (USEPA 2000).
- (t) The value presented in the RSL column is an allowable daily intake (ADI) level for essential human nutrients.
- (u) The value for total chromium was used for Federal and NJ criteria and the value for Chromium VI was used for the RSL.
- (v) Federal and State MCLs are based on action levels for these chemicals. Lead does not have an RSL, however the 15 µg/L action level (USEPA 1996a) is presented in the RBC column.
- (w) The non-food RSL value for manganese was used.
- (x) The value for inorganic mercury was used for the federal criteria, the value for total mercury was used for the NJ criteria and the RSL value was based on methyl mercury.
- (y) The value for soluble salts was used for the NJ criteria and the PQL.
- (z) The NJ value for total selenium was used.
- (aa) The RSL value for fluorine was used.
- (ab) Perchlorate does not have an RSL, however the 18 µg/L action level (USEPA 1998) is presented in the RBC column.
- (ac) The values for radiological parameters are in units of pCi/L.
- (ad) The value for combined radium-226 and radium-228 was used.
- (ae) Uranium is in units of ug/L The RSL for the most conservative soluble salts was used.
- (af) The values for asbestos are based on units of fibers/L>10µm.

Subject:  
Review of Risk Assessment Results for PICA 011 Group of Sites

---

As part of the development of the Feasibility Study for the PICA 011 Group of Sites, risk assessment results were reviewed at a number of sites where unacceptable potential risks were previously identified. This review was conducted in order to identify exposure pathways and chemicals of concern driving the potential risks at those sites in an effort to assist in the selection of the most appropriate remedial action for each site.

## **HUMAN HEALTH RISK ASSESSMENT**

Table 1 presents the potential reasonable maximum exposure (RME) excess lifetime cancer risk and/or noncancer hazard index for industrial workers and construction workers for the PICA 011 Group of Sites where unacceptable risks and/or hazards were previously identified. Sites with potential risks associated with exposure to lead in soil are also presented in Table 1. These risks are discussed in detail below. Note that all risk assessment results have been rounded to one significant figure following U.S. Environmental Protection Agency (USEPA 1989) guidance.

### **Sites with Unacceptable Potential Risks and/or Hazards**

Unacceptable potential cancer risks and/or noncancer hazards for industrial workers and/or construction workers were identified at 20 sites, as shown in Table 1. The risks at Site 82 were due to radiological

constituents; the unacceptable risks and/or hazards calculated for the remaining 19 sites were due to chemical constituents. For four of these sites, unacceptable hazards were calculated due solely to lead concentrations in soil. At the remaining 15 sites, unacceptable risks or hazards were calculated due to other chemical constituents (11 sites) or to a combination of lead and other constituents (4 sites). Therefore, a more detailed review of the risk assessment results for each of these sites was performed to identify the risk drivers and exposure pathways evaluated.

For many of the 15 sites at which chemical constituents (other than lead) resulted in unacceptable risks and/or hazards, the results of this review identified dermal absorption of chemicals of potential concern (COPCs) in soil as the most significant exposure pathway driving a majority of the cancer risk and/or noncancer hazard. However, recent USEPA (2002a and 2004) guidance indicates that the dermal pathway does not typically result in greater exposure to chemicals when compared with exposure associated with the direct ingestion of soil. In addition, as outlined in USEPA (2002a) guidance, dermal absorption of chemicals in soil is not a major exposure pathway for indoor industrial workers. Indoor workers have minimal direct contact with soil. Instead, the primary exposure pathways are ingestion of indoor dust and inhalation of indoor vapors (USEPA 2002a).

In response to this finding, an in-depth review of the previous dermal exposure assessment was conducted. This review included evaluating receptor-specific exposure parameters, chemical-specific dermal absorption factors, and the final risk calculations. The results of this in-depth review discovered that the soil-to-skin adherence factor (SSAF) used in those assessments was significantly higher than the value that is currently recommended by the USEPA (2004) for the industrial worker and construction worker scenarios. The SSAF describes the amount of soil that adheres to the skin per unit surface area (USEPA 2004). Citing an interim report by the USEPA (1992), a SSAF of 1 mg/cm<sup>2</sup>-event was previously used for evaluating dermal exposures to both the industrial worker and the construction worker. It is noted that more recent dermal guidance was available at the time the risk assessments were performed but was not incorporated into the previous risk assessments.

The sites where unacceptable risks and/or hazards were identified were re-evaluated using current USEPA (2004) recommendations for the SSAF parameter. However, the USEPA (2002a and 2004) does not recommend evaluating dermal absorption of COPCs in soil by indoor industrial workers because it is an insignificant pathway, and a recommended SSAF value is not available. Therefore, the default SSAF of 0.07 mg/cm<sup>2</sup>-event for an adult resident (USEPA 2004) was used in this re-evaluation. It is noted that this value is based on adherence of soil to outdoor gardeners, which represent a reasonable, high-end activity for residents. Because indoor industrial workers do not engage in outdoor gardening activities, the use of this factor provides a conservative (i.e., upper-bound) estimate of dermal absorption of COPCs in soil by indoor industrial workers. For construction workers, the USEPA (2004) recommended SSAF of 0.3 mg/cm<sup>2</sup>-event was used to re-evaluate dermal absorption of COPCs in soil. Table 2 presents the previous and revised dermal cancer risks and/or noncancer hazards, as well as the cumulative cancer risk and/or cumulative noncancer hazard. Note that potential risks at Site 82 (PICA 135) are associated with exposure

to radionuclides. Risks associated with exposure to radionuclides are evaluated using a different method than risks associated with dermal exposure to chemicals in soil. Therefore, Site 82 (PICA 135) was not re-evaluated and is not presented in Table 2.

The revised cumulative cancer risks were within the USEPA target risk range of (1E-04 to 1E-06) (USEPA 1991a) and/or the revised noncancer hazard index (HI) did not exceed 1 at 10 of the 15 sites (excluding the sites where lead and radionuclides were the only risk drivers) for which risks and or hazards had previously been reported due to exposure to chemicals in soils. At two of the sites, the recalculated total noncancer hazard exceeded 1 (Sites 139 in PICA 108 and Site 126 in PICA 122). However, when the hazard index was segregated by endpoint, the HI for each target organ/effect was less than or equal to one, indicating that adverse noncancer effects were unlikely.

The remaining four sites for which revised chemical cancer risks and/or noncancer hazards exceeded the acceptable benchmarks, and the single site (Site 82) for which unacceptable risks were due to exposure to radionuclides, are discussed below along with the primary risk drivers for each.

- Site 131 (PICA 091): The industrial worker cancer risk of 2E-04 is primarily associated with ingestion of arsenic in surface soil.
- Site 122 (PICA 011): The industrial worker noncancer HI of 8 and the construction worker HI of 40 are primarily associated with inhalation of manganese in soil.
- Site 118 (PICA 097): The industrial worker noncancer HI of 10 is primarily associated with ingestion of thallium and inhalation of manganese from surface soil. The construction worker HI of 90 is primarily associated with ingestion of thallium, and ingestion and inhalation of manganese from subsurface soil.
- Site 138 (PICA 108): The construction worker HI of 6 is primarily associated with inhalation of manganese from subsurface soil.
- Site 82 (PICA 135): The industrial worker cancer risk of 5E-04 is primarily associated with exposure to Radium 226, Radium 228 and their daughter products.

## **Development of Risk-Based Cleanup Goals**

Risk-based cleanup goals (RBCGs) were developed for the risk drivers identified above following USEPA (1991a) guidance. The RBCGs represent the average concentration at a site that would not result in an unacceptable risk (i.e., a cumulative potential cancer risk no greater than 1E-04 to 1E-06 or hazard index no greater than 1). The following equation was used to calculate the RBCGs:

$$RBCG = \frac{EPC \times (TR \text{ or } THI)}{(ELCR \text{ or } HI)}$$

Where:

- RBCG = Risk-based cleanup goal (mg/kg);
- EPC = Exposure point concentration used to calculate the cancer risk or noncancer hazard in the HHRA (mg/kg);
- TR = Target cancer risk (1E-06);
- THI = Target hazard index (1);
- ELCR = Chemical- or radionuclide-specific excess lifetime cancer risk as calculated in the HHRA (unitless); and
- HI = Chemical-specific noncancer hazard index as calculated in the HHRA (unitless).

RBCGs based on cancer effects were calculated using a 1E-06 target risk level. However, RBCGs are also presented for the 1E-04 and 1E-05 risk levels to reflect the range of RBCGs associated with USEPA's acceptable risk range. The RBCGs are presented in Table 3, and summarized below. Note that four of the calculated RBCGs are less than the site-specific background levels presented in Shaw (2005a) or current Levels of Concern (LOC), which for these constituents are based on New Jersey soil standards for non-residential direct contact ([http://www.nj.gov/dep/srp/regs/rs/rs\\_rule.pdf](http://www.nj.gov/dep/srp/regs/rs/rs_rule.pdf)) or radioactive materials (<http://www.state.nj.us/dep/rpp/ras/rasdown.htm>). In this case, the highest of the value, of the RBCG, site-specific background concentration, or LOC was selected as the final RBCG for these constituents.

**Summary of Risk-Based Cleanup Goals**

Chemical	RBCGc (mg/kg)			RBCGnc (mg/kg)	Background Level (mg/kg)	LOC <sup>1</sup> (mg/kg)	Final RBCG <sup>2</sup> (mg/kg)
	1E-06	1E-05	1E-04				
Surface Soil							
Arsenic	3.3	33	330	—	9.23	19	19
Manganese	—	—	—	2,000	1,250	5,900	5,900
Thallium	—	—	—	160	1.19	79	160
Radium-226(+D) (pCi/g)	0.022	0.22	2.2	—	1.31	5 <sup>3</sup>	5
Radium-228(+D) (pCi/g)	0.042	0.42	4.2	—	1.82	5 <sup>4</sup>	5 <sup>4</sup>
Combined Surface and Subsurface Soil							
Manganese	—	—	—	150	842	5,900	5,900
Thallium	—	—	—	230	1.5	79	230

1) Based on NJDEP standard for soils ([http://www.nj.gov/dep/srp/regs/rs/rs\\_rule.pdf](http://www.nj.gov/dep/srp/regs/rs/rs_rule.pdf)) except where noted

- 2) The final RBCG was selected as the RBCGc based on a 1E-06 risk level, RBCGnc, the background level, or the LOC, whichever is greater.
- 3) From NJDEP Soil Remediation Standard for Radioactive Materials (<http://www.state.nj.us/dep/rpp/ras/rasdown.htm>) for Limited Restricted Use.
- 4) No LOC available for Radium-228. Thus the LOC for Radium-226 was used as a surrogate.  
— = A RBCG was not calculated because chemical did not significantly contribute to the cancer risk or noncancer hazard  
RBCGc = Risk-based cleanup goal for cancer endpoint  
RBCGnc = Risk-based cleanup goal for noncancer endpoint

## Review of Chemical Results and Distribution at Each Site

The purpose of reviewing the results and distribution of the risk drivers at each site was to determine if a small area (or “hot spot”) was responsible for driving the majority of the risk. This will help focus remedial efforts on the areas of highest risk. In addition, the data set used to calculate the EPC at each site was reviewed because remedial action (including excavation) has occurred at some of the PICA 011 Group of Sites since the completion of the human health risk assessments. Refer to the Draft Feasibility Study for the PICA 011 Group of Sites for details on removal actions. The chemical results and distributions for the risk drivers for Sites 82, 118, 122, 131, and 138 are discussed individually below.

### *Site 82 (PICA 135)*

The cumulative cancer risk for Site 82 was 5E-04 due to concentrations of Radium-226, Radium-228 and their daughter products. Subsequently, an RBCG of 5 pCi/g was selected based on the LOC that was developed using the non-residential soil standard developed by NJDEP for Radium-226. A review of the sampling data for Radium-226 and Radium-228 at this site indicates that none of the surface soil sample results for these constituents exceeds the LOC. Thus there is no need for remedial action at this site.

### *Site 118 (PICA 097)*

The primary hazard driver for the HIs of 10 for the industrial worker and 90 for the construction worker at Site 118 was manganese. The maximum detected concentration of 13,000 mg/kg, detected in surface soil sample D-SB118-1, was used as the EPC for the risk assessment. However, all other locations sampled have manganese concentrations substantially lower than the RBCG of 5,900 mg/kg that has been calculated for manganese. The exclusion of the maximum concentration for manganese would reduce potential hazards below levels of concern. Thus, a response action will be proposed for the soils around this sampling location.

### *Site 122 (PICA 011)*

The primary hazard driver for Site 122 is manganese. The maximum detected concentration of 15,000 mg/kg, detected in surface soil, was used as the EPC for the surface soil risk assessment, which resulted in an HI of 8 for the industrial worker, and was largely responsible for the EPC of 6,770 mg/kg that was

used to derive an HI of 40 for the construction worker. However, surface soil at D-SS122-6, SS122-008, and D-122-SS122-009 all contribute to the 95-UCL that exceeds the RBCG. Thus, a response action will be proposed for the soils in these areas.

#### *Site 131 (PICA 091)*

The revised cumulative cancer risk for Site 131 was 2E-04, with the majority of that risk due to the presence of arsenic in surface soil that resulted in an EPC of 490 mg/kg. In order for risks to not exceed the upper end of the acceptable risk range (1E-04), the EPC would need to be roughly half or less of the value originally used in the risk calculations, or  $\leq 245$  mg/kg. A review of the arsenic data for surface soil indicates that there is only one location (131SS-13A), where the arsenic concentration exceeds this level. If the soils in that area are removed, the maximum arsenic concentration in remaining surface soils would be 126 mg/kg and the 95<sup>th</sup> upper confidence limit, which would be used as the EPC, would be 82 mg/kg, both of which are substantially below the 245 mg/kg associated with a 1E-04 risk.

#### *Site 138 (PICA 108)*

Manganese was also the primary hazard driver for Site 138 with a maximum concentration of 8,500 mg/kg located at SS138-6A. The remaining 23 samples taken at this site had manganese concentrations well below the RBCG of 5,900. Thus a response action will be proposed for the soils surrounding this sample location.

### **Lead Risk Assessment**

Although exposures to lead are known to cause adverse effects, neither a cancer slope factor (CSF) nor a reference dose (RfD) have been developed for this chemical. In addition, many health authorities [e.g., Centers for Disease Control (1991); Agency for Toxic Substances and Disease Registry (1991)] believe that it may be inappropriate to develop and/or use a CSF or RfD for lead since there may not be a true threshold for the effects of lead. As a result, the method used to evaluate the toxicity of lead is based on estimating the concentration of lead in the blood of the exposed individual, since chronic health effects associated with lead exposure have been related to elevated blood lead levels. In addition, as blood lead levels are dependent on both background exposure to lead and site-related exposures, and since adverse effects of lead are dependent upon the age of the exposed individual, measures of blood lead levels are believed to be a more accurate predictor of the potential effects of lead than are average daily exposure levels (daily doses).

The USEPA Adult Lead Model (ALM) (USEPA 1996) was used to evaluate potential risks associated with exposure to lead in soil at the Picatinny Arsenal. The ALM has the ability to either calculate blood lead levels associated with a given soil lead concentration, or calculate a preliminary remediation goal (PRG) for lead in soil given a target blood lead level. The USEPA has established a national health criterion

based on the expectation that no more than 5 percent of the potentially exposed population should exceed a blood lead level of 10 micrograms per deciliter (ug/dL) (USEPA 1994) as a result of their exposures.

Previously, the ALM was used to derive a range of PRGs for several potential receptor groups and the site-specific concentrations of lead in soils were compared with those PRGs to determine if there might be a risk of harm. It was concluded that there was an unacceptable risk associated with exposure if the average lead concentration was greater than the lowest PRG in the range for that receptor. The range of PRGs previously used to identify industrial worker risks associated with exposure to lead in soil at the Picatinny Arsenal was 778 – 1,354 mg/kg. The range of PRGs previously used to identify construction worker risks associated with exposure to lead in soil at the Picatinny Arsenal was 162 – 282 mg/kg. Thus, if the average lead concentration in surface soil was greater than 778 mg/kg, it was concluded that there was a risk of harm to the industrial worker, and if the average lead concentration in subsurface soils was greater than 162 mg/kg, it was concluded that there was a risk of harm to the construction worker.

The previously calculated ranges of PRGs were calculated using two different geometric standard deviations (GSDs)—1.8 and 2.1. The GSD addresses sources of variability in blood lead concentrations among the exposed population. A higher GSD is used to characterize heterogeneous populations and means that there is higher variability (and associated uncertainty in estimating the blood lead levels) in the exposed population. Higher GSDs result in lower PRGs.

### Lead Risk Assessment Results in the PICA 011 Group of Sites

Table 1 presents the average lead concentrations at each of the sites in the PICA 011 Group of Sites where they exceeded the lowest PRG for an industrial worker (778 mg/kg) or a construction worker (162 mg/kg). Potential lead risks were identified at four sites for an industrial worker and seven sites for a construction worker. Therefore, a more detailed examination of the risk assessment results for each of these sites was performed. This was done in a two step process. First, the ALM input parameters used to calculate the PRGs were evaluated in comparison to current recommendations; and, 2) the lead distribution at each site was evaluated to determine if a small area (or “hot spot”) was resulting in an elevated average lead concentration.

#### *Review of ALM Input Parameters*

Shaw (2005a,b,c) used USEPA (1996) recommended input parameters to calculate the lead PRGs for an industrial worker. These input parameters, as well as the input parameters used to calculate the PRGs for construction workers, are summarized below:

### Summary of Previous ALM Input Parameters

Parameter	Explanation of Parameter	Previous Value used for Industrial Worker	Previous Value used for Construction Worker
$PbB_{fetal, 0.95}$	95 <sup>th</sup> percentile blood lead concentration in fetus (ug/dL)	10	10
$PbB_{receptor, baseline}$	Baseline blood lead concentration	2.0	2.0
BKSF	Biokinetic slope factor (ug/dL per ug/day)	0.4	0.4
IRs	Ingestion rate of soil (g/day)	0.050	0.480
AFs	Absolute gastrointestinal absorption fraction	0.12	0.12
EFs	Exposure frequency (days/yr)	250	125
AT	Averaging time (days/year)	365	365
$R_{fetal/maternal}$	Fetal/maternal blood lead level ratio	0.9	0.9
GSD	Geometric standard deviation	1.8 & 2.1	1.8 & 2.1

While calculating a range of PRGs is useful for understanding the range of potential risks, it is difficult for risk managers to make remedial decisions when average lead concentrations fall within the range of PRGs. Therefore, the input parameters were reviewed and updated, and a single PRG was calculated for use as a bright line for making remedial decisions.

The input parameters originally used in the lead risk assessments to derive PRGs were based on Phase 1 of the Third National Health and Nutrition Evaluation Survey (NHANES III, Phase 1) (Brody et al. 1994). However, data from Phase 2 of the NHANES III (USEPA 2002c), which included sensitive populations, became available subsequent to the Phase 1 recommendations. Phase 2 of the NHANES III provided average baseline blood lead concentrations and GSDs based on race/ethnicity for several regions in the United States. The average baseline blood lead concentration and GSD for a heterogeneous population (i.e., recommended values for all race/ethnicities) in the Northeast Region were reported to be 1.98  $\mu\text{g}/\text{dL}$  and 2.00  $\mu\text{g}/\text{dL}$ , respectively. Thus, these values were used to recalculate the lead PRG for both industrial workers and construction workers.

For the industrial worker, it is noted that the USEPA (1996) recommended exposure frequency should be 219 days/year, based on the average time spent at work by both full-time and part-time workers. Finally, the soil ingestion rate previously used to calculate the PRG for construction workers (480 mg/kg) was based on a theoretical calculation for adults engaged in outdoor activities (USEPA 1991b). The USEPA revised these values after substantial research (e.g., Stanek et al. 1997) showed that this value significantly overestimated adult soil ingestion rates. Since the input parameters for the ALM are based on

central tendency values, the USEPA currently recommends using a soil ingestion rate of 100 mg/kg for evaluating construction worker risks to lead in soil (USEPA 2007).

Using these currently recommended values, the PRGs for industrial worker and construction worker exposure to lead in soil were recalculated to be 1,092 mg/kg and 957 mg/kg, respectively. Attachment 1 shows the ALM and calculation of the revised PRGs.

As shown in Table 1, the average soil lead concentrations exceed the relevant, revised PRGs at two sites: Site 139 (PICA 108) and Site 115 (PICA 175). At Site 139 (PICA 108) the average lead concentration in surface soil exceeds the revised PRG for industrial workers. In addition, the average combined surface/subsurface soil lead concentration at Site 139 (PICA 108) and Site 115 (PICA 175) exceeds the revised PRG for construction workers. Therefore, lead sampling results and the distribution of lead at these sites were further evaluated. The average lead concentration at Site 102 (PICA 075), Site 118 (PICA 097), Site 111 (PICA 108), PICA 209 (Building 303), and PICA 209 (Building 430) were less than the revised PRGs for industrial workers and/or construction workers; therefore, no further review was necessary at these sites.

### *Review of Lead Results and Distribution at Each Site*

The purpose of reviewing the lead results and distribution at each site where the average lead concentration exceeded the revised PRG was to determine if a small area (or “hot spot”) was responsible for driving the majority of the risk. This analysis helps focus remedial efforts on the areas of highest risk. In addition, the data set used to calculate the average soil lead concentration at each site was reviewed because remedial action (including excavation) has occurred at several of the PICA 011 Group of Sites since the completion of the lead risk assessments. (Refer to the Feasibility Study for the RIP 2009 Group of Sites for details on removal actions.)

#### Site 139 (PICA 108)

The average lead concentration of 1,543 mg/kg was based on surface soil samples collected between 1993 and 2000. This average was driven primarily by the maximum lead concentration of 24,000 mg/kg detected in sample F-SS139-4 in November 1993. However, additional soil samples were collected in August 2000 at and around this location to further delineate lead concentrations in this area. As the table below summarizes, lead concentrations in the August 2000 samples were significantly less than the maximum concentration. Based on the August 2000 samples, it appears that the reported result for F-SS139-4 was an anomaly and that it is unlikely that lead is present at the concentration reported for F-SS139-4. Therefore, this sample was excluded from the data set. After accounting for a removal action that occurred at Site 139 (PICA 108) in 2004 (Shaw 2005d), the new maximum lead concentration in surface soil was determined to be 835 mg/kg. This is lower than the recalculated PRG of 1,092 mg/kg for the industrial worker.

The average combined surface and subsurface soil lead concentration of 1,397 mg/kg was also driven primarily by the maximum lead concentration of 24,000 mg/kg reported for sample F-SS139-4. As discussed above, this concentration appeared to be an anomaly and was eliminated from the data set. Using the remaining data for surface soil, and accounting for the removal action that occurred (Shaw 2005d), a new maximum concentration for combined surface/subsurface soil was determined to be 835 mg/kg. This maximum concentration is below the revised PRG of 957 mg/kg calculated for the construction worker. Thus, the average concentrations are certainly less than the PRGs, indicating that there are no unacceptable risks associated with exposure to lead in soil at Site 139 (PICA 108).

**Summary of Lead Concentrations Around Sample F-SS139-4**

Soil Sample	Lead Concentration (mg/kg)	Proximity to F-SS139-4
F-SS139-4	24,000	—
F-139-SS-016	416	Co-located with F-SS139-4
F-139-SS-015	316	ca. 10 ft to the west of F-SS139-4
F-139-SS-014	415	ca. 10 ft to the south of F-SS139-4
F-139-SS-013	326	ca. 10 ft to the east of F-SS139-4
F-139-SS-012	835	ca. 10 ft to the north of F-SS139-4

Site 115 (PICA 175)

The lead concentration of 1,030 mg/kg in subsurface soil, which was used to determine potential hazards due to lead, exceeds the revised PRG of 957 mg/kg for construction workers. However, this concentration is based on a single subsurface soil sample (Sample ID 115SB-1B) that was collected at a depth of 9.5 to 10 feet. Further evaluation of lead data from this site indicates that a total of 37 samples (1 subsurface and 36 surface samples) have been collected at this Site and analyzed for lead. When the sample results from all of these samples are combined and averaged, as is appropriate considering that excavation activities would result in the mixing of surface and subsurface soils, the average concentrations for total soil is 604 mg/kg. This is well below the PRG of 957 mg/g for this scenario, indicating that there are no unacceptable risks to construction workers associated with exposure to lead at this Site.

**Human Health Risk Assessment Summary and Conclusions**

Risk assessment results were reviewed and verified for the PICA 011 Group of Sites where potentially unacceptable cancer risks and/or noncancer hazards were identified for industrial workers and/or construction workers. The purpose of this review was to identify the exposure pathways and chemicals of concern driving the potential risks in an effort to assist in the selection of the most appropriate remedial action for each site. In addition, sites with potential risks associated with industrial worker and construction worker exposure to lead in soil were also reviewed.

The 15 sites where the industrial worker and/or construction worker cumulative cancer risk exceeded  $1 \times 10^{-4}$  or the cumulative noncancer hazard index was greater than 1, due to chemical constituents other than lead, were reviewed. Dermal contact with soil accounted for the majority of the cumulative risk and/or hazard at several sites. However, it is uncharacteristic that dermal absorption would drive a majority of exposure compared to the exposure due to direct ingestion of soil. In addition, dermal absorption of chemicals in soil is not a major exposure pathway for indoor industrial workers per USEPA (2002a) guidance. Therefore, the parameters used to calculate dermal cancer risks and noncancer hazards were re-evaluated, and one parameter was revised to reflect current USEPA (2004) guidance. The cumulative cancer risk and noncancer hazard index was re-calculated at each site where unacceptable risks and/or hazards were identified using the revised dermal absorption parameter.

The revised results indicate that unacceptable cancer risks associated with industrial worker exposure to soil was present at only one site—Site 131 (PICA 091). The revised noncancer hazard index was greater than 1 for an industrial worker at Site 122 (PICA 011) and Site 118 (PICA 097), and for a construction worker at Site 122 (PICA 011), Site 118 (PICA 097), and Site 138 (PICA 108). Finally, unacceptable cancer risks at Site 82 (PICA 135) were associated with industrial worker exposure to radionuclides. At Site 82, none of the sample data exceed the RBCGs; therefore, no active remedy is recommended.

For lead, the PRGs for industrial workers and construction workers were recalculated to be 1,092 mg/kg and 957 mg/kg, respectively. These values were recalculated based on current USEPA guidance and are recommended for use in making remedial decisions for lead in soil. The average lead concentrations at Site 102 (PICA 075), Site 118 (PICA 097), Site 111 (PICA 108), Site 209 (Building 303), and Site 209 (Building 430), which had exceeded the previously calculated PRG range, were less than the relevant, revised PRGs. Therefore, no further evaluation of these sites is necessary.

The average lead concentration in surface soil and in combined surface and subsurface soil at Site 139 (PICA 108) was greater than the relevant, revised PRGs. For this reason, the lead results for Site 139 (PICA 108) were evaluated and recent removal actions were reviewed to determine if unacceptable potential risks are still present. It was discovered that lead in one sample was significantly greater than the rest of the samples and it was responsible for elevating the average lead concentration. However, sampling results at and around this location failed to produce similar results. Consequently, it was concluded that it is likely that the maximum concentration is an anomaly and this sample result was excluded from the data set. After removal of that sample result and accounting for a recent removal action at that site, the revised maximum lead concentration was below the revised PRG. These results indicate that there are no unacceptable risks associated with exposure to lead in soil at Site 139 (PICA 108).

The single subsurface soil lead concentration at Site 115 (PICA 175) exceeded the revised PRG for construction workers. However, when this sample was averaged with the 36 surface soil samples to derive an average concentration for total soil, the result was an average concentration of 604 mg/kg. This

is well below the revised PRG of 957 mg/kg for the construction worker, indicating that there are no unacceptable risks associated with exposure to lead in soil at Site 115 (PICA 175).

## ECOLOGICAL RISK ASSESSMENT

Table 4 provides a summary of the evaluation of ecological risks at the Group 11 sites. The majority of the sites evaluated in Group 011 were eliminated from consideration in the ecological risk assessments based on the lack of suitable habitat. Of those evaluated, most were found to pose minimal risk to ecological receptors. However, five sites were determined to require further evaluation (Table 5). A summary of each of these sites is provided below.

### Site 2 – Buildings 3500 through 3551

Site 2 was owned by the Department of the Army and was leased to the Naval Air Rocket Test Station (NARTS) division of the Navy which entered into a sublease agreement with the Reaction Motors Division (RMD) of Thiokol Chemical Company from 1947 to 1968. RMD tested and evaluated rocket engines and their related components at Site 2. Surface runoff from Site 2 most likely discharges to Stillwell Pond, the G-2 Swamp or a small stream to that north and ultimately to the G-2 Pond. Soil, surface water and sediment were evaluated as part of the ecological risk investigation (IT Corp. 2000); however, the surface water and sediment media are not included in the P011 LUC FS, and are not discussed herein.

To investigate risks to terrestrial species, an earthworm bioassay was conducted on site soils (IT Corp. 2000). The bioassay indicated a significant decrease in survival compared to reference or control samples, however it was noted that soils for the test were collected from an area that had been significantly altered, including the spreading of gravel for maintenance work. It was concluded that the observed toxicity could likely be attributed to the physical characteristics of the soil rather than the presence of COCs. Potential impacts to upper trophic level species such as small mammals (white-footed mouse *Peromyscus leucopus*), worm-eating birds (woodcock, *Scolopax minor*), and carnivorous birds (barred owl, *Strix varia*) were also evaluated by calculating Environmental Effects Quotients (EEQs) for each species through a food web exposure model (IT Corp. 2000). The EEQs represent the ratio of potential exposure concentrations to toxicological benchmarks. An EEQ value less than 1 indicates that the potential for risk is minimal. The calculated EEQs were less than 1 for all chemicals with the exception of the arsenic and aluminum EEQ for the white-footed mouse, which were slightly elevated. Based on these results, it was determined that risks to terrestrial receptors were minimal and did not require further evaluation at this site (IT Corp. 2000; Shaw 2005h).

**Site 64—Building 241, Explosives Press Loading and Disassembly Facility**

The majority of the Building 241 Site is occupied by buildings and paved areas. However, there is a forested area behind the site that is contiguous with Site 131 (Shaw 2005f). Therefore, the terrestrial portion of the site was evaluated in conjunction with Site 131. In addition, there is potential for runoff into Bear Swamp Brook. As a result, surface water and sediment were evaluated as part of that investigation (IT Corp. 2000; Shaw 2005f); however, the surface water and sediment for Bear Swamp Brook have been addressed through the Final Record of Decision, Green Pond Brook/Bear Swamp Brook (Shaw 2004).

To investigate risks to terrestrial species, an earthworm bioassay was conducted on site soils that had elevated PAH, arsenic, and beryllium concentrations (IT Corp. 2000). The bioassay indicated no significant difference in survival compared to reference or control samples. Potential impacts to upper trophic level species such as small mammals (white-footed mouse *Peromyscus leucopus*), worm-eating birds (woodcock, *Scolopax minor*), and carnivorous birds (barred owl, *Strix varia*) were also evaluated by calculating Environmental Effects Quotients (EEQs) for each species through a food web exposure model (IT Corp. 2000). The EEQs represent the ratio of potential exposure concentrations to toxicological benchmarks. An EEQ value less than 1 indicates that the potential for risk is minimal. The calculated EEQs were less than 1 for all chemicals with the exception of the arsenic EEQ for the white-footed mouse, which was slightly elevated. Based on these results, it was determined that risks to terrestrial receptors were minimal and did not require further evaluation (Shaw 2005f).

**Site 62—Building 210, Hazardous Waste**

Historically, wastes at Building 210 were disposed of in a utility sink, through a sump pump in the basement, and through floor drains. In addition, the basement periodically flooded and may have discharged contaminated water into Bear Swamp Brook (Shaw 2005f). There is limited terrestrial habitat associated with Site 62, largely consisting of mowed areas with little vegetative cover. Therefore, it was assumed that risks to terrestrial receptors would be minimal. However, because of potential discharges, sediment and surface water were evaluated as part of the Bear Swamp Brook investigation described for Site 64 (Shaw 2005f). Surface water and sediment for Bear Swamp Brook have been addressed through the Final Record of Decision, Green Pond Brook/Bear Swamp Brook (Shaw 2004).

**Site 100—Building 276, Explosives Loading Facility**

Unauthorized dumping likely occurred in the vicinity of Building 276 (Shaw 2005f). The area around the building has largely reverted to its natural condition and is contiguous with a forested area. In addition, there is a portion of the site that is included within Bear Swamp. Therefore, risks to terrestrial receptors including small mammals (white-footed mouse), worm-eating birds (woodcock), and carnivorous birds (barred owl) were evaluated. In addition, sediment and surface water were evaluated as part of the Bear

Swamp and Bear Swamp Brook assessment described for Site 64 (Shaw 2005f), and are addressed through the Final Record of Decision, Green Pond Brook/Bear Swamp Brook (Shaw 2004)..

With respect to the terrestrial receptors, a food web exposure model was conducted to develop EEQs as described for Site 64 (IT Corp. 2000). The EEQs for all species were below 1 with the exception of the EEQ for arsenic for the white-footed mouse. Based on these results, it was concluded that there were minimal risks to terrestrial species and no further evaluation was recommended (Shaw 2005f).

### **Site 128—Buildings 235, Explosives Production and Pressing Facility**

Building 235 was constructed in 1918 as an explosives production facility, involving powder mixing, unit density measurements, and pack out activities. Explosive melt cast operations also occurred there. Wastewater from production operations were discharged via a trough to a safety box which flowed into a tributary of Bear Swamp Brook. The Site is surrounded by a potentially sensitive area, which along with the tributary provides habitat for both terrestrial and wetland/aquatic species (Shaw 2005f).

With respect to the terrestrial receptors, a food web exposure model was conducted to develop EEQs as described for Site 64 (IT Corp. 2000). The EEQs for all species were below 1 with the exception of the EEQ for arsenic for the white-footed mouse. Based on these results, it was concluded that there were minimal risks to terrestrial species and no further evaluation was recommended (Shaw 2005f).

Risks to benthic invertebrates within the tributary were evaluated by comparing measured sediment concentrations to available sediment toxicity reference values (TRVs) (IT Corp. 2000). TRVs represent concentrations at which effects are not expected; therefore, the ratio of measured concentrations to these values is equivalent to the EEQ for the food web exposure model. Based on this assessment, mercury was identified as the primary risk driver, with an EEQ of 133. However, it was noted that the surface water in the tributary is intermittent in nature and thus may not support a significant benthic population year-round. As a result, persistent populations of benthic receptors were not expected based on habitat constraints and actual risks may have been less than predicted (Shaw 2005f).

### **Ecological Risk Assessment Summary and Conclusions**

In general, ecological risks at the site were determined to be limited based on lack of suitable habitat. Those sites where risks were identified were associated with Bear Swamp Brook, which is addressed through the Final Record of Decision, Green Pond Brook/Bear Swamp Brook (Shaw 2004). For the Swamp and the tributaries, it was noted that the areas potentially posing a risk to benthic and aquatic species are only wet intermittently and likely do not support a significant population due to habitat constraints and no further evaluation was recommended.

Table 1  
Summary of Unacceptable Potential Risks  
PICA 011 Group of Sites  
Picatinny Arsenal, New Jersey

Site # (PICA#) - Site Name	Receptor	Potential Risk/Hazard	Reference
Site 1 (PICA 008) - Naval Air Rocket Test Station, Test Area G	Construction Worker	[Pb] = 470 mg/kg	IT Corporation, 2001a
Site 122 (PICA 011) - Bldg 60, Satellite Waste Accumulation Area	Industrial Worker Construction Worker	Risk = 2E-4; HI = 8 HI = 40	Dames & Moore, 1998
Site 29 (PICA 071) and Site 45 (PICA 084) - Drum Storage Area (Bldg 31 Yard) and Vehicle Maintenance (Bldg 33)	Industrial Worker	Risk = 2E-4	IT Corporation, 2001b
Site 102 (PICA 075) - Former Enlisted Mens Barracks (Bldg 3050)	Industrial Worker	Risk = 7E-4; [Pb] = 849 mg/kg	Shaw, 2005a
Site 188 (PICA 075) - Former Coal Storage Area (Bldg 3173)	Industrial Worker	Risk = 3E-4	Shaw, 2005b
Site 55 (PICA 091) - Bldgs in 200-Area (Bldgs 221, 223, and 225)	Industrial Worker	HI = 5	Shaw, 2005f
Site 100 (PICA 091) - Explosive Loading Facility (Bldg 276)	Industrial Worker	Risk = 2E-4	Shaw, 2005f
Site 131 (PICA 091) - Former Ordnance Manufacturing (Bldg 266)	Industrial Worker	Risk = 5E-4; HI = 3	Shaw, 2005f
Site 118 (PICA 097) - Building 41, Pesticide Storage and Former Oil/Water	Industrial Worker Construction Worker	HI = 10 HI = 90; [Pb] = 273 mg/kg	Dames & Moore, 1998 and Shaw, 2005c
Site 111 (PICA 108) - Buildings 454 and 455, Propellant Bag Filling	Construction Worker	[Pb] = 182 mg/kg	Dames & Moore, 1998 and Shaw, 2005d
Site 138 (PICA 108) - Bldgs 404, 407, and 408, Chemical Lab and Propellant Plants	Construction Worker	HI = 6	Dames & Moore, 1998 and Shaw, 2005c
Site 139 (PICA 108) - Buildings in 400/300 Area	Industrial Worker Construction Worker	[Pb] = 1543 mg/kg HI = 3; [Pb] = 1397 mg/kg	Dames & Moore, 1998 and Shaw, 2005d
Site 126 (PICA 122) - Building 197, Propellant Testing	Construction Worker	HI = 4	Dames & Moore, 1998 and Shaw, 2005c
Site 30 (PICA 134) - Building 3045, Fluorochemicals Storage	Industrial Worker	Risk = 4E-4	Shaw, 2005a
Site 82 (PICA 135) - XRAY Photoprocessing Lab (Bldg 908)	Industrial Worker	Risk = 5E-4	Shaw, 2005a
Site 79 (PICA 136) - Building 3013, High Pressure Boiler	Industrial Worker	Risk = 2E-4	Shaw, 2005a
Site 115 (PICA 175) - Ordnance Bldgs in 600 Area	Construction Worker	[Pb] = 1030 mg/kg	Shaw, 2005b
PICA 209 (Bldg 167)	Industrial Worker	Risk = 4E-4	Shaw, 2005c
PICA 209 (Bldg 303)	Industrial Worker Construction Worker	[Pb] = 984 mg/kg HI = 2; [Pb] = 371 mg/kg	Shaw, 2005c
PICA 209 (Bldg 430)	Industrial Worker Construction Worker	[Pb] = 965 mg/kg [Pb] = 398 mg/kg	Shaw, 2005c

Risk = Excess lifetime cancer risk  
HI = Noncancer hazard index  
[Pb] = Average lead concentration in mg/kg

Table 2  
Evaluation of Dermal and Cumulative Cancer Risks  
PICA 011 Group of Sites  
Picatinny Arsenal, New Jersey

Site # (PICA#) - Site Name	Industrial Worker Cancer Risk				
	Previous Dermal Cancer Risk <sup>(a)</sup>	Previous Cumulative Cancer Risk	Revised Dermal Cancer Risk <sup>(b)</sup>	Revised Cumulative Cancer Risk	Primary Risk Drivers <sup>(c)</sup>

Site # (PICA#) - Site Name	Construction Worker Noncancer Hazard				
	Previous Dermal Noncancer Hazard <sup>(a)</sup>	Previous Cumulative Noncancer Hazard	Revised Dermal Noncancer Hazard <sup>(d)</sup>	Revised Cumulative Noncancer Hazard	Primary Risk Drivers <sup>(c)</sup>
Site 122 (PICA 011) - Bldg 60, Satellite Waste Accumulation Area	0.3	40	0.09	40	Manganese
Site 118 (PICA 097) - Building 41, Pesticide Storage and Former Oil/Water Separator	NA	90	NA	90	Thallium and manganese
Site 138 (PICA 108) - Bldgs 404, 407, and 408, Chemical Lab and Propellant Plants	0.02	6	0.006	6	Manganese
Site 139 (PICA 108) - Buildings in 400/300 Area	NA	3	NA	3 <sup>(e)</sup>	--
Site 126 (PICA 122) - Building 197, Propellant Testing	3	4	0.9	2 <sup>(e)</sup>	--
PICA 209 (Bldg 303)	0.6	2	0.2	1	--

NA = Not applicable due to lack of toxicity criteria at the time of the risk assessment

(a) Cancer risks/noncancer hazard calculated using a soil-to-skin adherence factor of 1 mg/cm<sup>2</sup>-event.

(b) Cancer risks/noncancer hazard calculated using a soil-to-skin adherence factor of 0.07 mg/cm<sup>2</sup>-event for an indoor industrial worker.

(c) Primary risk drivers are presented when the revised cancer risk is greater than the target risk range of 10<sup>-4</sup> to 10<sup>-6</sup> or the revised noncancer hazard index is greater than 1.

(d) Cancer risks/noncancer hazard calculated using a soil-to-skin adherence factor of 0.3 mg/cm<sup>2</sup>-event for a construction worker.

(e) The HI for each target organ/effect is less than or equal to one, indicating adverse noncancer effects are unlikely.

Table 3  
Calculation of Risk-Based Cleanup Goals for Primary Chemical Risk Drivers  
PICA 011 Group of Sites  
Picatinny Arsenal, New Jersey

Site # (PICA#) - Site Name	Industrial Worker Cancer Risk						
	Revised Cumulative Cancer Risk	Primary Risk Drivers	EPC (mg/kg)	Risk Due to Risk Driver	RBCG (mg/kg) <sup>(1)</sup>	LOC (mg/kg)	Final RBCG <sup>(3)</sup> (mg/kg)
Site 131 (PICA 091) - Former Ordnance Manufacturing (Bldg 266)	2E-04	Arsenic	490	1E-04	3.3	19	19
Site 82 (PICA 135) - XRAY Photoprocessing Lab (Bldg 908)	5E-04	Radium-226(+D)	3.9 pCi/g	2E-04	0.022 pCi/g	5	5
		Radium-228(+D)	4.5 pCi/g	1E-04	0.042 pCi/g	5	5
		Thorium-228(+D)	NA	NA	NA <sup>(2)</sup>	NA	NA
Site # (PICA#) - Site Name	Industrial Worker Noncancer Hazard						
	Revised Cumulative Noncancer Hazard	Primary Risk Drivers	EPC (mg/kg)	Hazard Due to Risk Driver	RBCG (mg/kg) <sup>(1)</sup>	LOC (mg/kg)	Final RBCG <sup>(3)</sup> (mg/kg)
Site 122 (PICA 011) - Bldg 60, Satellite Waste Accumulation Area	8	Manganese	15000	8	2000	5900	5900
Site 118 (PICA 097) - Building 41, Pesticide Storage and Former Oil/Water Separator	10	Thallium	590	4	160	79	160
		Manganese	13000	7	2000	5900	5900
Site # (PICA#) - Site Name	Construction Worker Noncancer Hazard						
	Revised Cumulative Noncancer Hazard	Primary Risk Drivers	EPC (mg/kg)	Hazard Due to Risk Driver	RBCG (mg/kg) <sup>(1)</sup>	LOC (mg/kg)	Final RBCG <sup>(3)</sup> (mg/kg)
Site 122 (PICA 011) - Bldg 60, Satellite Waste Accumulation Area	40	Manganese	6800	45	150	5900	5900
Site 118 (PICA 097) - Building 41, Pesticide Storage and Former Oil/Water Separator	90	Thallium	590	3	230	79	230
		Manganese	13000	86	150	5900	5900
Site 138 (PICA 108) - Bldgs 404, 407, and 408, Chemical Lab and Propellant Plants	6	Manganese	900	6	150	5900	5900

EPC = Exposure point concentration  
pCi/g = Picocuries per gram  
RBCG = Risk-based cleanup goal

- (1) RBCG based on a target cancer risk of  $10^{-6}$  or a target HI of 1.  
(2) A RBCG was not calculated for thorium-228 (+D) because it is a daughter product of radium-228 and, therefore, it will be addressed concurrently with radium-228.  
(3) Final RBCG is based on the RBCG or the LOC, whichever is higher.

Table 4  
Summary of Ecological Risk Assessments  
PICA 011 Group of Sites  
Picatinny Arsenal, New Jersey

PICA/Minor PICA	Site	Name	Media	Conclusions	Reference
<b>Sites Not Evaluated in the Ecological Risk Assessment</b>					
108/210	210	Building 321	Soil	The majority of the 0.6 acre site is paved and surrounded on three sides by roads, resulting in a lack of suitable habitat. In addition, interim removal actions at the site to address zinc levels have limited potential for exposure. Therefore, no ERA was conducted.	PTA.017.0124B
175	151	Building 600	Soil	Due to the small size (0.5 acres), low on-site habitat value, and continued use as a debris storage area, this site was not evaluated in the ERA.	PTA.T005.008C
97	118	Building 41, Pesticide Storage and Fomer Oil/Water Separator	Soil	Site less than 0.1 acre in size, predominantly mowed and maintained vegetation which offers little habitat; no ERA conducted	PTA.017.0129B
108/138	90	Electromagnetic Gun Test Shed	Soil	Little to no suitable habitat, therefore, site not evaluated in ERA	PTA.T005.008C
108/147	137	Administrative Building	Soil	Limited habitat. No ERA conducted due to urban nature of the site.	PTA.T005.008C
108/104	111	Buildings 454 and 455	soil	Based on the limited area of contamination and the lack of habitat, an ecological risk assessment was not warranted.	PTA.017.0124B
209	209	Building 167, High Explosives Preparation and Testing Laboratory	Soil	Site is very small (0.1 acres) and located in very high use area, therefore, exposures are expected to be minimal and no ERA conducted.	PTA.017.0124B
209	209	Former Building 426	soil	Site is very small (0.1 acres) and located in very high use area, therefore, exposures are expected to be minimal and no ERA conducted.	PTA.T005.008C
209	209	Building 303, locomotive house	soil	Site is located in very high use area, therefore, exposures are expected to be minimal and no ERA conducted.	PTA.017.0124B
134	70	Bldg 3028 & 3029	Soil	Limited available on-site habitat consists of mowed lawns. Data from the site represents areas adjacent to buildings, the parking lot or rubble. Lack of suitable habitat limits potential for exposure therefore site not evaluated in ERA.	PTA.T005.008C
135	71	General Purpose Laboratory	Soil	Site adjacent to Picatinny Lake, but limited habitat quality. Site considered too small to elicit foodchain effects, therefore not evaluated in ERA.	PTA.T005.008C
75/86	47	Building 3005 & 3006	Soil	Limited suitable on-site habitat, therefore, site not evaluated in ERA	PTA.T005.008C
13	78	Building 91, Optics Prototype Facility	Soil, sediment	Elevated soil concentrations restricted to very small area immediately adjacent to buildings in area that is predominantly paved or mowed and maintained grass offering little habitat. Similarly, elevated sediment concentrations are in drainage canals providing no significant aquatic habitat. No evidence of adverse impacts to ecological communities downstream has been observed. Therefore, no ERA was conducted	PTA.TO17.0091B
175	152	Buildings 604 and 604C	Soil, Sediment	No chemicals detected in soils. Possible release to sediments of Bear Swamp Brook, but impacted area addressed in an earlier FS, therefore, no further evaluation required.	PTA.017.0124B
175	153	Building 606	soil	Site consists of mowed areas and buildings, therefore, limited suitable available habitat and ecological exposures are assumed to be minimal. Based on the limited contamination, small size, and level of industrialization, no ERA was recommended.	PTA.017.0124B
91	55	Explosives Inspection Facility	soil	Site 55 is a non-forested area with little suitable habitat. Most Site 55 samples collected close to buildings in areas with large boulders. As a result, food chain effects are unlikely and no ERA was conducted.	PTA.T005.008C PTA.T017.0060Q
91/127	127	Building 230	Soil	Limited site habitat. Most samples from mowed areas surrounded by buildings and pavement. Little cover available. Food chain effects unlikely and not evaluated in the ERA.	PTA.T005.008C
91/128	128	Building 236	Soil	No samples collected near building, so no ERA conducted	PTA.T005.008C

Table 4  
 Summary of Ecological Risk Assessments  
 PICA 011 Group of Sites  
 Picatinny Arsenal, New Jersey

PICA/Minor PICA	Site	Name	Media	Conclusions	Reference
91/129	129	Building 240	Soil	Due to small size and urban nature of site, not evaluated in ERA	PTA.T005.008C
91/130	130	Building 252	Soil	Site habitat is of limited quality, therefore, not evaluated in ERA	PTA.T005.008C
200	200	Solvent Storage Facility, Building 1038	Soil	Significant exposure by wildlife unlikely because of low level of contaminants and size of the site (0.1 acre). Therefore, no BERA conducted.	PTA.017.0124B
200	200	Building 1030, Acid Tank Farm	Soil	This area was evaluated as part of the Area L ecological risk investigation. Food chain modeling results for Area L indicated limited potential risks, however, field studies showed no evidence of impact on local populations. Based on the overall weight of evidence, it was concluded that there were no significant effects on the local ecological populations.	PTA.017.0124B
200	200	Assembly and Packing Building 1090	Soil	No COPC detected, therefore, no BERA conducted.	PTA.017.0124B
200	200	Buildings 1415 & 1414, 1414A propellant dry houses	Soil	Significant exposure by wildlife unlikely because of low level of contaminants and size of the site (0.1 acre). Therefore, no BERA conducted.	PTA.017.0124B
200	200	Building 1437, cast propellant plant	Soil	Significant exposure by wildlife unlikely because of low level of contaminants and size of the site (0.1 acre). Therefore, no BERA conducted.	PTA.017.0124B
134/012	83	Building 3022	Soil	On-site habitat is mowed. Soil samples collected adjacent to buildings, parking lot or transformer; therefore site not evaluated in ERA.	PTA.T005.008C
135/158	158	Building 926	Soil, sediment, surface water	Due to small size and low quality of habitat, soil not evaluated in ERA. Sediment and surface water evaluated as part of Pictinny Lake.	PTA.T005.008C
136	79	Building 3013	Soil	Limited habitat, primarily mowed. Not evaluated in ERA	PTA.T005.008C

Table 4  
 Summary of Ecological Risk Assessments  
 PICA 011 Group of Sites  
 Picatinny Arsenal, New Jersey

PICA/Minor PICA	Site	Name	Media	Conclusions	Reference
<b>Sites Determined to Pose Minimal Risk</b>					
71	29 and 45	Building 31 and 33 Sites	Soil	Buildings 31 & 33 Site is relatively industrialized with habitat consisting mostly of paved area around existing buildings and limited grassy areas. Because of the limited size and low quality habitat, determined unlikely to have significant ecological impacts.	OTHF.0014B OTHF.0022B
75	36	Building 3100	Soil	Small site (less than 0.4 acres) evaluated as part of Northern Area L. Based on the analyses, it was concluded that although the food web modeling indicated potential risks, the overall weight of evidence indicates no significant effects on ecological population.	PTA.017.0124B
108	140	Buildings 427 and 427B	Soil, sediment	Site not included in ERA because of limited habitat. Based on comparison with nearby sites, elevated lead concentrations associated with sediments in two concrete ditches pose the only potential risk to ecological receptors. These ditches do not represent significant suitable habitat for species of concern, therefore, it was concluded that risks to populations would be minimal.	PTA.TO17.0015B
209	209	Building 462A, General Purpose Magazine	Soil	Site is small (0.1 acres). There is a drainage ditch, but the intermittent nature does not provide suitable habitat for aquatic receptors. Bioassays indicate no toxicity to soil invertebrates. In addition, sediment and surface water downstream were evaluated as part of Green Pond Brook evaluation. Though there is suitable woody habitat for terrestrial exposures, removal of sediment from sumps has eliminated potential exposure pathways. No further ERA recommended.	PTA.017.0124B
		Building 430, Propellant Systems Facility	Soil	Site is small (0.025 acres). There is a drainage ditch, but the intermittent nature does not provide suitable habitat for aquatic receptors. Bioassays indicate no toxicity to soil invertebrates. In addition, sediment and surface water evaluated as part of Green Pond Brook evaluation. Though there is suitable woody habitat for terrestrial exposures, removal of lead from surface soil behind Building 430 has eliminated potential terrestrial exposure pathways. No further ERA recommended.	PTA.017.0124B
8	1	Naval Air Rocket Test Station	Soil	Soil bioassay and foodchain modeling suggest that there is little potential risk to mammalian and avian species.	PTA.T005.008C PTA.TO17.0063E
8	4	3600 Series Buildings	Soil, sediment, surface water	Little potential risk to mammalian and avian species based on foodchain analyses. Aquatic bioassays indicated potential impacts relative to control, however, growth and survival comparable to reference. Overall weight of evidence indicates no significant effects on ecological populations.	PTA.T005.008C PTA.TO17.0063E
175	115	Building 611, Ammunition Testing Facility	Soil	Elevated HQs, but because actual exposure area is so small, determined that risk was insignificant	PTA.017.0124B
131	131	Building 266	Soil	Modeled risk and results of soil bioassay indicate minimal risk to terrestrial receptors	PTA.T005.008C PTA.T017.0060Q
50	3	Former Ract MTRs/Rocket Fuel Test A 1500 (Area 1500 Buildings)	Soil, sediment, surface water	Aquatic bioassays indicated impacts, however, only minor effects noted in benthic surveys. Overall, concluded no significant impacts to ecological populations	PTA.T005.008C PTA.T017.0055G
122	126	Building 197, Propellant testing	Soil	Overall site is small (0.1 acre) and the affected area is very small (0.03 acres) making the likelihood of significant exposure small. In addition, small mammal studies and earthworm bioassays conducted in the area indicated no impact.	PTA.017.0124B

Table 4  
 Summary of Ecological Risk Assessments  
 PICA 011 Group of Sites  
 Picatinny Arsenal, New Jersey

PICA/Minor PICA	Site	Name	Media	Conclusions	Reference
200	200	Wastewater Incinerator Building, Building 1037	Soil	Based on relatively low concentrations of COCs in soil and the small size of the site, risks to terrestrial receptors were concluded to be minimal. Risks to aquatic receptors were evaluated as part of Robinson Run. Based on multimetric approach (New Jersey Impairment Score [NJIS]) benthic communities not at significant risk.	PTA.017.0124B
91/132	132	Building 271	Soil	Little potential risk to mammalian and avian species based on foodchain analyses	PTA.T005.008C PTA.T017.0060Q
135	159	Building 975	soil, sediments	Sediment bioassays exhibited significant toxicity, however, the benthic survey indicated that habitat quality was equal to or better than upstream reference areas. Little risk to mammalian or avian species based on foodchain modeling of soil exposures.	PTA.T005.008C PTA.T017.0060K
175	154	Buildings 617 & 617G, Field Office and Disassembly Facility	Soil	Elevated HQs, but because actual exposure area is so small, determined that risk was insignificant	PTA.017.0124B
134	30	Building 3045	Soil	Minimal risk to terrestrial species based on foodchain modeling	PTA.T005.008C PTA.T017.0060K
91/125	98	Building 268	Soil	Little potential risk to mammalian and avian species based on foodchain analyses.	PTA.T005.008C PTA.T017.0060Q
108	138	Buildings 404, 407, 408, Chemical Lab Propellant Plants	Soil, surface water, sediments	Food web modeling indicated potential risks, but overall weight of evidence indicates no significant effects on ecological population	PTA.017.0124B
108	139	Building 424	Soil, surface water marsh	Food web modeling indicated potential risks, but overall weight of evidence indicates no significant effects on ecological population	PTA.017.0124B
137	82	Building 908, X-ray Photo Processing Laboratory	Soil, sediment	Soil bioassays showed no significant difference in toxicity between the site and the reference and control samples. Risks to aquatic receptors evaluated as part of Picatinny Lake assessment.	PTA.T005.008C PTA.T017.0060L
162	5	Shell Burial Area Near Building 3150	Soil	Sampling not possible at Area 5, therefore, results of Northern Area L studies assumed to apply. Food web modeling indicated potential risks, but overall weight of evidence indicates no significant effects on ecological population.	PTA.017.0124B
162	6	Shell Burial Area Near Building 3100	Soil	Sampling not possible at Area 6, therefore, results of Northern Area L studies assumed to apply. Food web modeling indicated potential risks, but overall weight of evidence indicates no significant effects on ecological population.	PTA.017.0124B
75	102	Building 3050	Soil	Soil bioassay and foodchain modeling suggest that there is little potential risk to mammalian and avian species.	PTA.T005.008C PTA.T017.0060K
75	188	Former Coal Storage Area, Building 3173	Soil, sediment, surface water	Food web modeling indicated potential risks, but overall weight of evidence indicates no significant effects on ecological population	PTA.017.0124B

Table 4  
 Summary of Ecological Risk Assessments  
 PICA 011 Group of Sites  
 Picatinny Arsenal, New Jersey

PICA/Minor PICA	Site	Name	Media	Conclusions	Reference
<b>Sites Requiring Further Evaluation in the Feasibility Study</b>					
8	2	Buildings 3500 through 3551	Soil, sediment, surface water	Little potential risk to mammalian and avian species based on foodchain analyses. Aquatic bioassays indicated potential impacts relative to control, however, growth and survival comparable to reference. Sediment bioassays indicated potential impacts relative to reference and control, therefore, site-specific Potential Effect Levels (PELs) developed for consideration in the FS.	PTA.T005.008C PTA.TO17.0063E
91/124	64	Building 241	Soil	Modeled risk estimates and results of soil bioassay indicate minimal risks to terrestrial species. Sediment and SW evaluated as part of Bear Swamp Brook.	PTA.T005.008C PTA.T017.0060Q
91/126	100	Building 276	Soil	Little potential risk to mammalian and avian species based on foodchain analyses. Mercury in sediment may pose a risk to benthic species.	PTA.T005.008C PTA.T017.0060Q
91/123	62	Building 210	Soil	Site not evaluated in ERA due to limited habitat. Sediment and SW evaluated as part of Bear Swamp Brook.	PTA.T005.008C PTA.T017.0060Q
91/128	128	Building 235	Soil	Food chain modeling suggested limited risk to terrestrial species. However, mercury in sediment samples indicated potential risk to benthic invertebrates. However, due to the intermittent nature of the surface water in the tributary, actual risks to benthic populations are likely lower than predicted.	PTA.T005.008C PTA.T017.0060Q

## **Appendix D**

Engineering Assumptions for No  
Further Action with Monitoring of  
Land Use

**Alternative 2 – No Further Action with Monitoring**

Description:

Land Use Controls (LUC) will be implemented to minimize the exposure pathway for areas which drive the unacceptable human health risks and hazards. LUCs will consist of land use restrictions and the installation of signs prohibiting specific activities at the site.
